Management Inventory

Project No.: W-65-R-37

Job Title: Statewide Upland Game

Job No.: A-4

Inventory and Management

Period Covered: October 1, 1988 to September 30, 1989

Abstract: This report includes upland game inventory and harvest data collected during 1988-89. Results of annual inventory and harvest surveys and long-term trends of indices derived by each method are included in the final report. Data obtained in 1989 are compared to 1988 and long-term averages.

Objectives:

1. Conduct efficient breeding and production surveys.
2. Determine annual harvest, hunters, hunter-days and success rates.
3. Inventory critical seasonal habitat.

Procedures:

Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1988 through February 10, 1989, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 22 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and gray partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 22. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1988 for comparable grounds were determined on a county basis.

The Gambel's quail long period waterhole counts were completed in July and August. Limited valley quail random brood counts were made in several counties.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 22. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were mailed to determine the harvest of upland game birds, cottontail rabbit, and snowshoe hare. A sample of eligible licensees from the current year's (1989) resident small game license file and 1989 combination license file was used. The modified computerized pull-apart mailer was again used to obtain harvest data. Separate questionnaires were mailed to all band-tailed pigeon, ptarmigan and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day, plus success for each season.

The upland game questionnaires were analyzed by the Division of Wildlife Resources information systems services subsection. Band-tailed pigeon, wild turkey and ptarmigan questionnaires were analyzed separately by Game Management personnel.

Upland game hunters were checked at checking stations, and random field checks were made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

During this segment, work continued on delineation of critical habitat for sage grouse in Strawberry Valley, Wasatch County, Randolph area in Rich County, and Diamond Mountain in Uintah County. Critical seasonal use areas were mapped from radio locations and observations. Results are being reported in master's thesis and peer-reviewed articles in scientific journals. Information on critical use areas is being added to our Geographic Information System. None of this work used Pittman-Robertson funds.

Recommendations: This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the nineteenth edition of this annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, game managers and the upland game management staff of the Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each species of upland game hunted in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1989, a total of 66,976 Utah sportsmen spent 484,996 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 497,403 animals. The proportion of the total upland game hunters which pursued each species is shown in Table 2 and the percentage failing to bag at least one bird of each species in Table 3. The regulations for 1989 upland game hunting seasons are shown in Appendix D.

Table 1. Summary of harvest statistics from the mail questionnaire for 1989.

Species	Hunters Afield	Total Harvest	Hunter Days	Bag per Hunter-day	Bag/Hunter For Season
Pheasant	50,382	80,769	177,364	0.46	1.60
Mourning dove	21,696	190,328	76,372	2.49	8.77
Chukar partridge	10,910	27,628	40,384	0.68	2.53
Sage grouse	9,002	13,710	19,373	0.71	1.52
Forest grouse	16,988	45,487	50,631	0.90	2.68
Quail	3,111	7,384	8,607	0.86	2.37
Hungarian partridge	2,136	3,920	6,035	0.65	1.83
Wild turkey	477	59	1,568	0.04	0.12
Band-tailed pigeon	23	24	159	0.80	1.00
Sharp-tailed grouse	0	0	0	--	--
Ptarmigan	3	13	6	2.16	4.33
Cottontail	22,878	120,075	91,264	1.32	5.25
Snowshoe	4,895	8,006	13,233	0.61	1.64

TOTAL -- 497,403 484,996 -- --

Total hunters afield for all species of upland game = 66,976

HARVEST QUESTIONNAIRE

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter questionnaire. The combined upland game bird and rabbit-hare questionnaire was again used.

A total of 12,894 upland game questionnaires, a 12.2 percent sample, were mailed. Of the total, 590 (4.6%) questionnaires were undeliverable. Of the 12,304 questionnaires delivered, 5,105 (39.6%) usable upland game questionnaires were returned. Of those, 1,876 purchased a license but did not hunt upland game. By dividing the total of 105,880 eligible licensees by the usable returns (5,105), a projection factor of 20.742018 is derived.

The 1989 hunter questionnaire sample size decreased from 1988, but a follow-up questionnaire was not sent to those who failed to return the first one. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

Table 2. Number and percent of total upland game hunters afield who reported hunting each game species during 1983-89.

Species	Number of Hunters					Percent of Total								
	1983	1984	1985	1986	1987	1988	1989	1983	1984	1985	1986	1987	1988	1989

TOTAL HUNTERS***	90,592	88,431	81,119	71,259	68,174	70,142	66,976							

*Includes both spring and fall hunts.

**Although wild turkey, band-tailed pigeon, ptarmigan and sharp-tailed grouse harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

***Note: This is not the total of the columns because many upland game hunters hunted more than one species.

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for wild turkey, band-tailed pigeon, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is a completely random sample (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess or lie, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long term trend in these indices should be used in managing the populations.

Presently, the upland game annual report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans, and assessing impacts on wildlife habitat.

RING-NECKED PHEASANT

SUMMARY

Based on the 1988 harvest data, the 1989 statewide breeding population decreased from the previous year. January and February 1989 were much colder than normal and may have affected survival of brood stock. Emergent vegetation still had not returned to inundated mud flats around the Great Salt Lake after the flooding of 1984.

Weather conditions during the nesting season were good in 1989. Statewide monthly average temperatures were above normal; average precipitation was below normal across several climatic subdivisions April through May. Temperatures were at or above normal and precipitation at or below normal through the rest of the year. Drought conditions in Utah may have negatively influenced brood survival. Fewer pheasants were observed, and fewer hens appeared to have young. Overall, production was down.

Harvest statistics compiled from the questionnaire indicated reduced success compared to 1988. All harvest indices declined and were below average, resulting in the lowest recorded values since 1950. Opening weekend success was down compared to the previous year based upon field bag check data. Hunters did not react to reduced pheasant populations in a strongly density dependent fashion. While they hunted fewer days or not at all, the reduction in hunters and days hunted was not in direct proportion to the reduction in harvest and the average number of hours hunted remained about the same.

Winter Sex Ratio Counts

Results of the survey for the winter of 1988-89 and long-term trends are shown in Tables 1, 2 and Figure 2 of this section. Statewide comparisons to the winter of 1987-88 and the 10-year average are as follows:

	<u>Winter of 1988-89</u>	<u>Percent change from 1987-88</u>	<u>Average</u>
Total pheasants counted (roadside)	1,076	-58	-78
Hens per cock	3.1	-24	-19
Pheasants observed per 100 hours	1,251	-27	-6
Total hours effort (roadside)	86	-43	-73

Winter sex ratio counts indicated a 27 percent decrease in pheasants observed per unit of effort. However, density estimates can be biased due to the non-random nature of the survey technique if effort is minimal. The hen-cock ratio decreased 24 percent from 1988 and was 19 percent below the long term average. Access was good but the lack of snow kept birds scattered and counting conditions were not as good as previous years. Less than average effort also reduced pheasant observations. No effort was expended in the Southeastern Region.

Roadside Counts

A summary of summer roadside pheasant counts for 1989 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8 and Figure 4. Summer 1989 survey results compared to 1988 and the previous 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total pheasants observed	975	-38	-61
Total miles driven	1,464	-24	-37
Pheasants per mile	0.71	-12	-34
Average brood size	4.6	-13	-13
Young per hen	2.95	-20	-27
Percent of hens with young	64	-11	-16

December 1988 through February 1989 temperatures were well below normal. The average monthly temperature of all reporting stations in the seven climatic subdivisions in Utah were 5 and 6 degrees below normal in January and February, respectively (Appendix A). However, temperatures in March and April were 6 and 6.5 degrees above normal, respectively. Precipitation was at or below normal all year. Temperature was slightly above normal and precipitation slightly below normal during the critical month of May. The North Central and Uintah Basin climatic subdivisions (major pheasant distribution) had below normal precipitation in May, which should have increased nesting success. However, this below average precipitation continued through December, resulting in drought over most of the state. Average temperatures in both subdivisions were at or above average March through December. Brood survival may again have declined due to hot, dry weather May through August.

Pheasant production decreased from 1988 in Utah. Production and hunter success were down in all areas except central Utah. The statewide density index (pheasants per mile) decreased from 0.81 in 1988 to 0.71 in 1989, and is 34 percent below the 10-year average (1.07).

Little emergent vegetation due to alkaline soils around the Great Salt Lake continued to reduce both the quantity and quality of wintering, nesting and brood rearing habitat in Box Elder, Salt Lake, Davis, and Weber counties.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire for 1989 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12, Figure 1 and total statewide harvest statistics in Table 13 and Figure 3. A comparison of 1989 harvest statistics to 1988 and the 41-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Pheasant hunters	50,382	-8	-38
Pheasants harvested	80,769	-17	-64
Hunter-days afield	177,364	-4	-20
Pheasants per hunter-day	0.46	-13	-53
Pheasants per hunter	1.60	-11	-41

Hunters were told to expect poor hunting with success similar to 1988. Low breeding populations were noted and production was poor for those birds which made it through the winter. We predicted 55,000 hunters and 100,000 harvest.

Total hunters again decreased 8 percent from 1988 and remained below the long-term (1948-88) average. Total harvest decreased 17 percent from 1988. Hunter success (pheasants per hunter-day) decreased 13 percent from 1988. Pheasants per hunter also decreased 11 percent.

Long-term trends (1970-89) of total hunters, hunter-days, harvest and hunter success are shown in Figures 3 and 4. Generally, the recent trend is toward less hunter-days with declines in total pheasants harvested and hunter success. We believe this is the result of the accumulated effects of loss of quantity and quality of habitat due to urbanization, flooding, and modern agricultural practices.

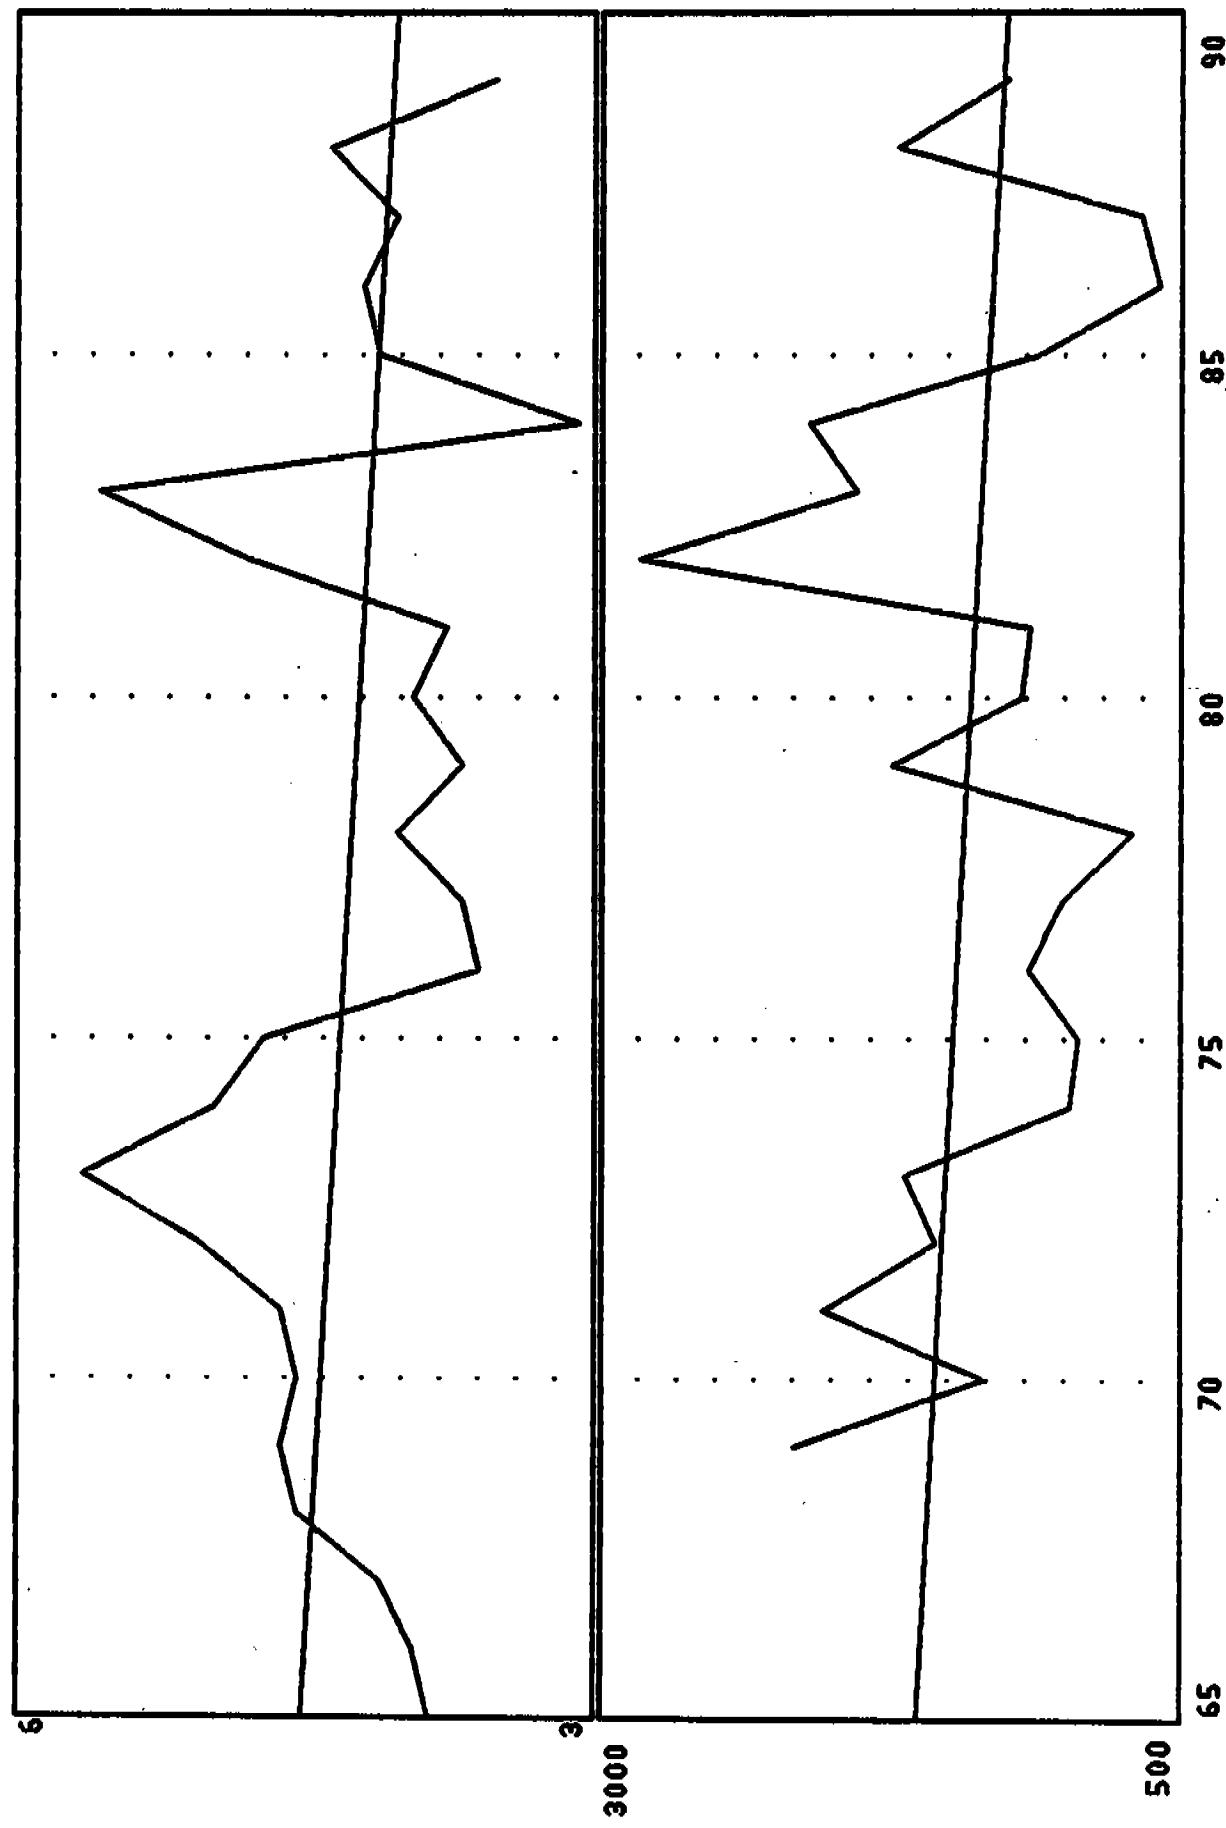

Figure 1. Pheasant's winter sex ratio indices, 1965-89.

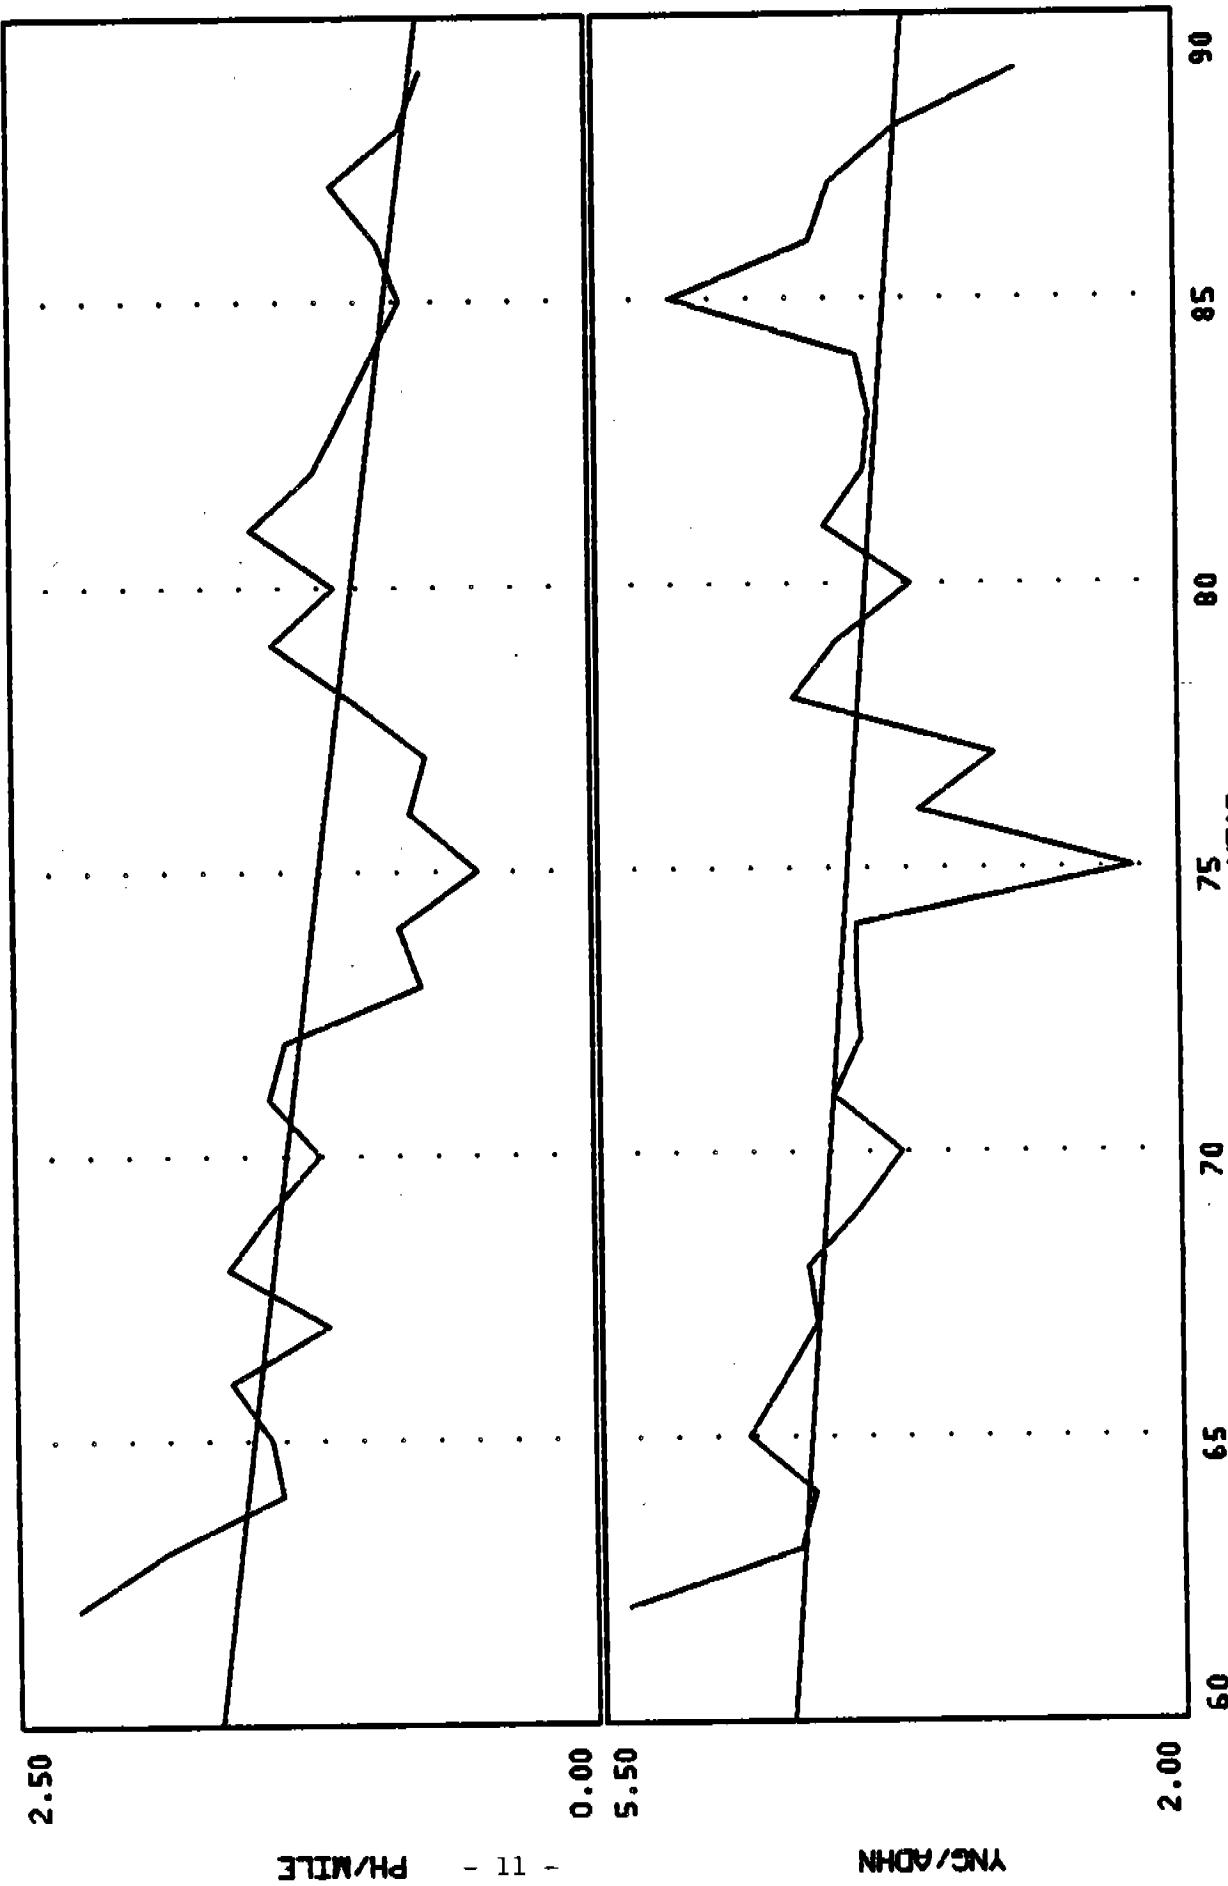

Figure 2. Statewide trend of pheasant harvest statistics.

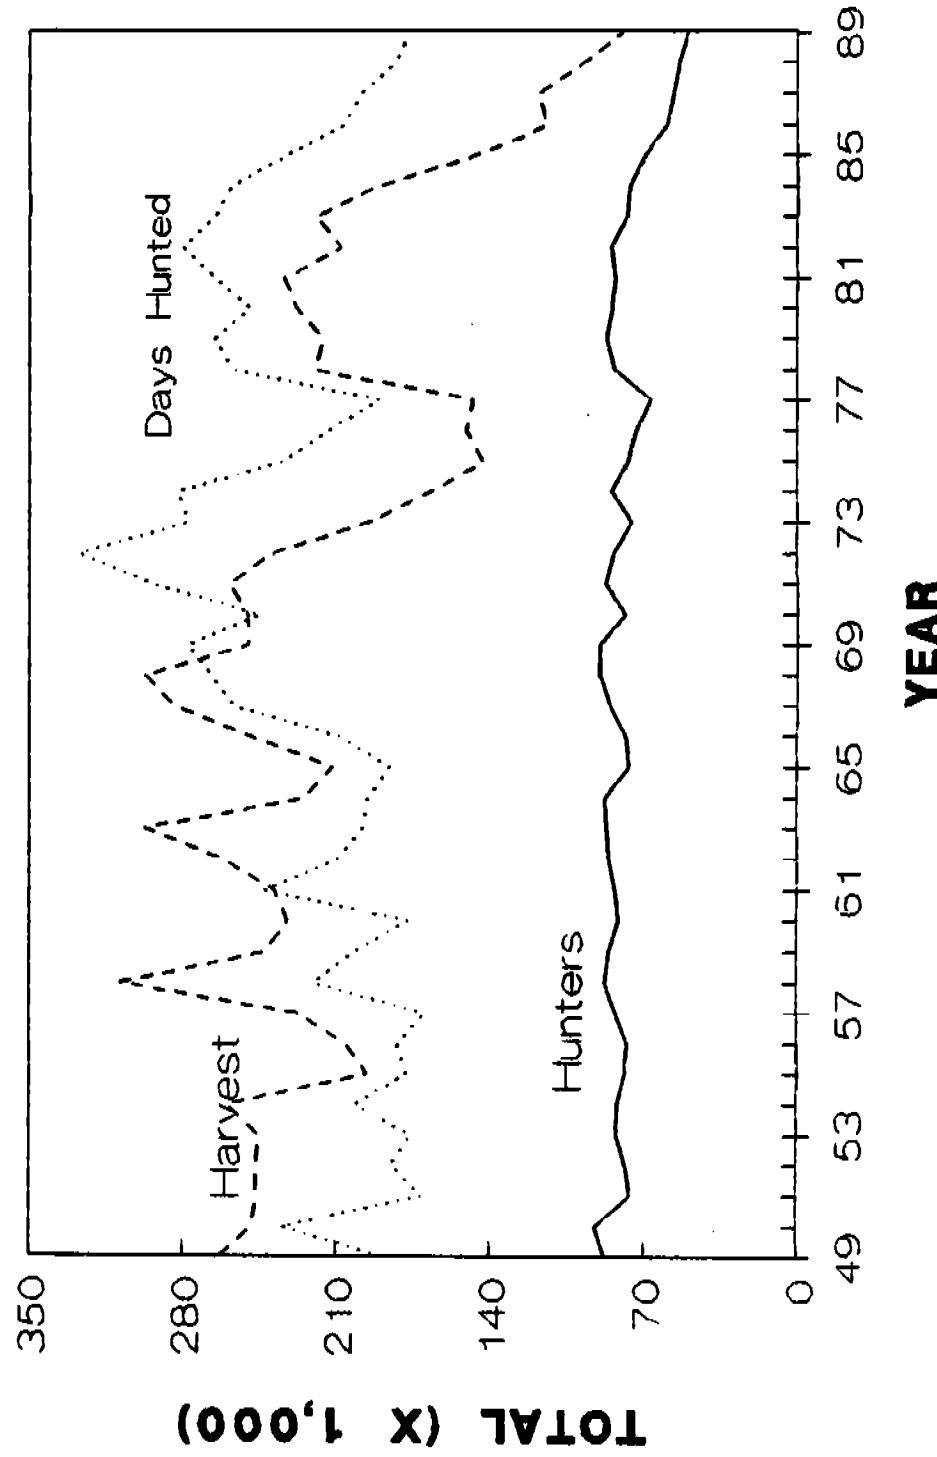

Figure 3. Statewide trend of pheasant harvest statistics, 1949-89.

PHEASANTS PER HUNTER AND PER DAY

Figure 5. Statewide pheasant field bag check indices, 1962-89.

Field Bag Checks

A summary of pheasant field bag check data for 1989 is shown in Table 14. The hunter success trend determined via bag checks since 1984 is found in Table 15 and Figure 5. A comparison of 1989 data, on a statewide basis, to 1988 and the 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total hunters checked	2,086	-19	-45
Total hours hunted	5,917	-19	-50
Pheasants per hunter (complete hunts)	0.30	-14	-52
Pheasants bagged per 100 hours	10	-9	-41
Average hours per hunter-day (complete hunts)	2.9	-6	-19
Hours hunted per pheasant bagged (complete hunts)	9.7	+9	+52

Checking Station Report

Storms late in the month of October (25th through the 28th) brought above normal accumulations to most stations along the Wasatch Front and to many stations in the west-central part of the state. On November 4th the area was dominated by high pressure. The first 24 days of November were dry with mostly clear skies. Temperatures averaged 1 to 3°F above normal. Our opening weekend, maximum daily temperatures were in the high 50's, low 60's, with only traces of precipitation in the mountains.

Hunting pressure was down in most of Utah. Pressure was up slightly in the northern part of the state. This is attributed to decreasing pheasant populations and to less land being accessible to hunters. Statewide hunter success was down compared with 1988 on opening weekend as well as the entire season. The pheasant season on Ute tribal trust lands opened on the same date as the state season, November 4, 1989, which precluded some of the boundary problems and feelings of resentment that existed the previous year.

MIGRATORY UPLAND GAME BIRDS

SUMMARY

Mourning Doves

The breeding density index remained stable in 1989, but it was below average.

Harvest statistics derived from the questionnaire indicated the same number of hunters, but increased harvest compared to 1988. Hunter success for the season increased 10 percent.

Field bag checks also indicated an increase in hunter success on opening day. Hunters who participated hunted fewer hours than the previous year.

Aging of wings indicated the juvenile per 100 adult ratio decreased to 77 compared to 100 in 1989, and the 8-year average of 112. Either production was down or juvenile doves migrated earlier than previous years.

Band-tailed Pigeons

A band-tailed pigeon hunting permit was required again in 1988 to obtain mailing addresses for a questionnaire. Twenty-nine hunters purchased permits but only 11 went afield. In 1989, 41 permits were sold but only 23 hunters actually participated. Hunter interest and harvest remained small as during the 1970-82 period.

MOURNING DOVE

Call Count Survey

Results of the 1989 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the Fish and Wildlife Service. However, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1989 survey to 1988 and the average for the period 1964-1988:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Average doves heard per route	9.3	-1	-28
Average calls heard per route	43.5	+3	-21
Average doves seen per route	19.9	+8	+38

Coo count data indicated similar breeding activity in late May compared to 1988, but was 28 percent below the long-term average of 13 doves heard per route.

Harvest

Hunter Questionnaire

Information obtained from the hunter questionnaire for 1989 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7 and Figure 2,3. The following is a comparison of the harvest statistics for 1989 compared to 1988 and the 10-year (1979-88) average:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Mourning dove hunters	21,696	-3	-25
Mourning dove harvest	190,328	+7	-30
Hunter-days afield	76,372	0	-23
Mourning doves per hunter-day	2.49	+6	-9
Mourning doves hunter	8.77	+10	-6

A decrease in dove hunter success was predicted due to no change in the spring dove call count index and summer drought. We predicted 22,500 hunters, 200,000 harvest and 80,000 hunter days. Hunter success increased slightly. Total harvest increased 7 percent compared to 1988. Numbers of dove hunters,

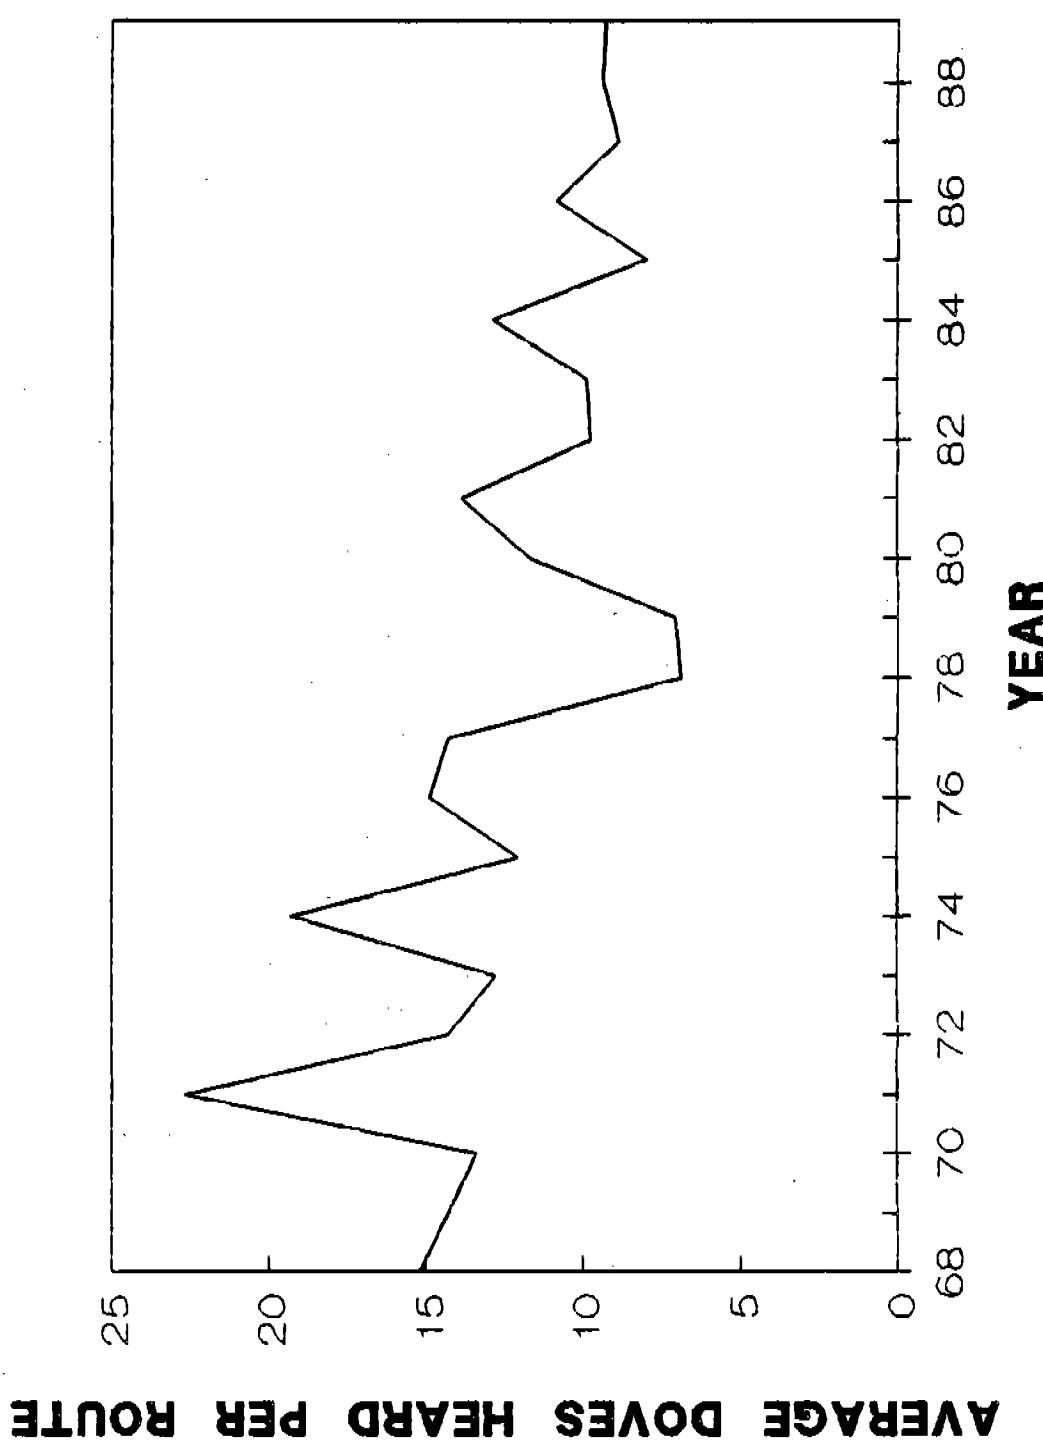

Figure 1. Mourning dove breeding density index trend, 1968-89.

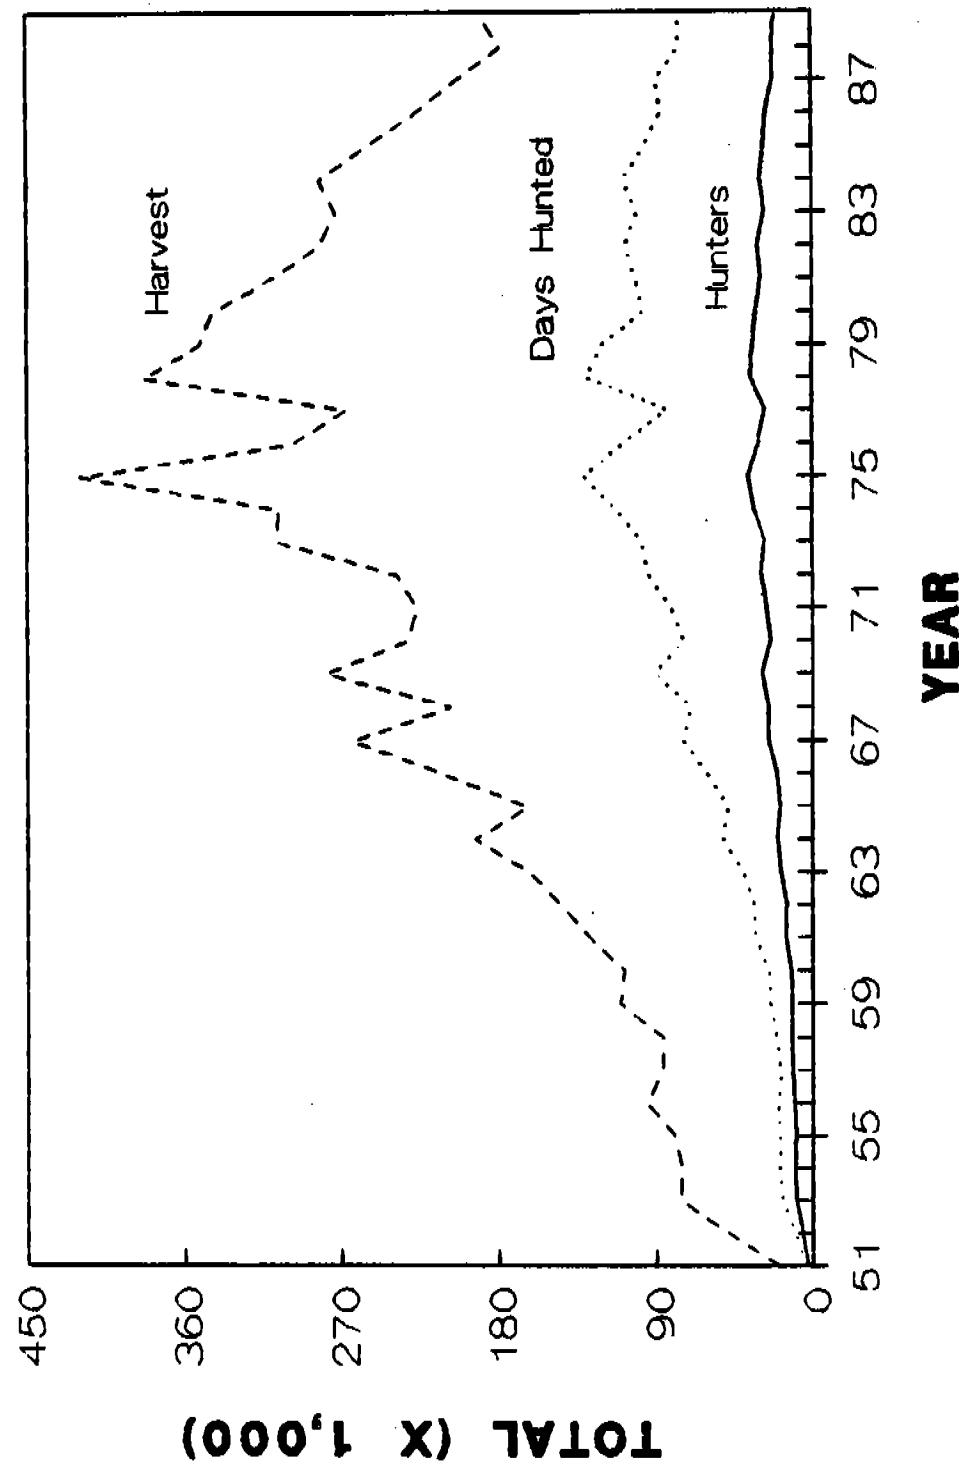

Figure 2. Statewide trends of mourning dove harvest statistics, 1951-89.

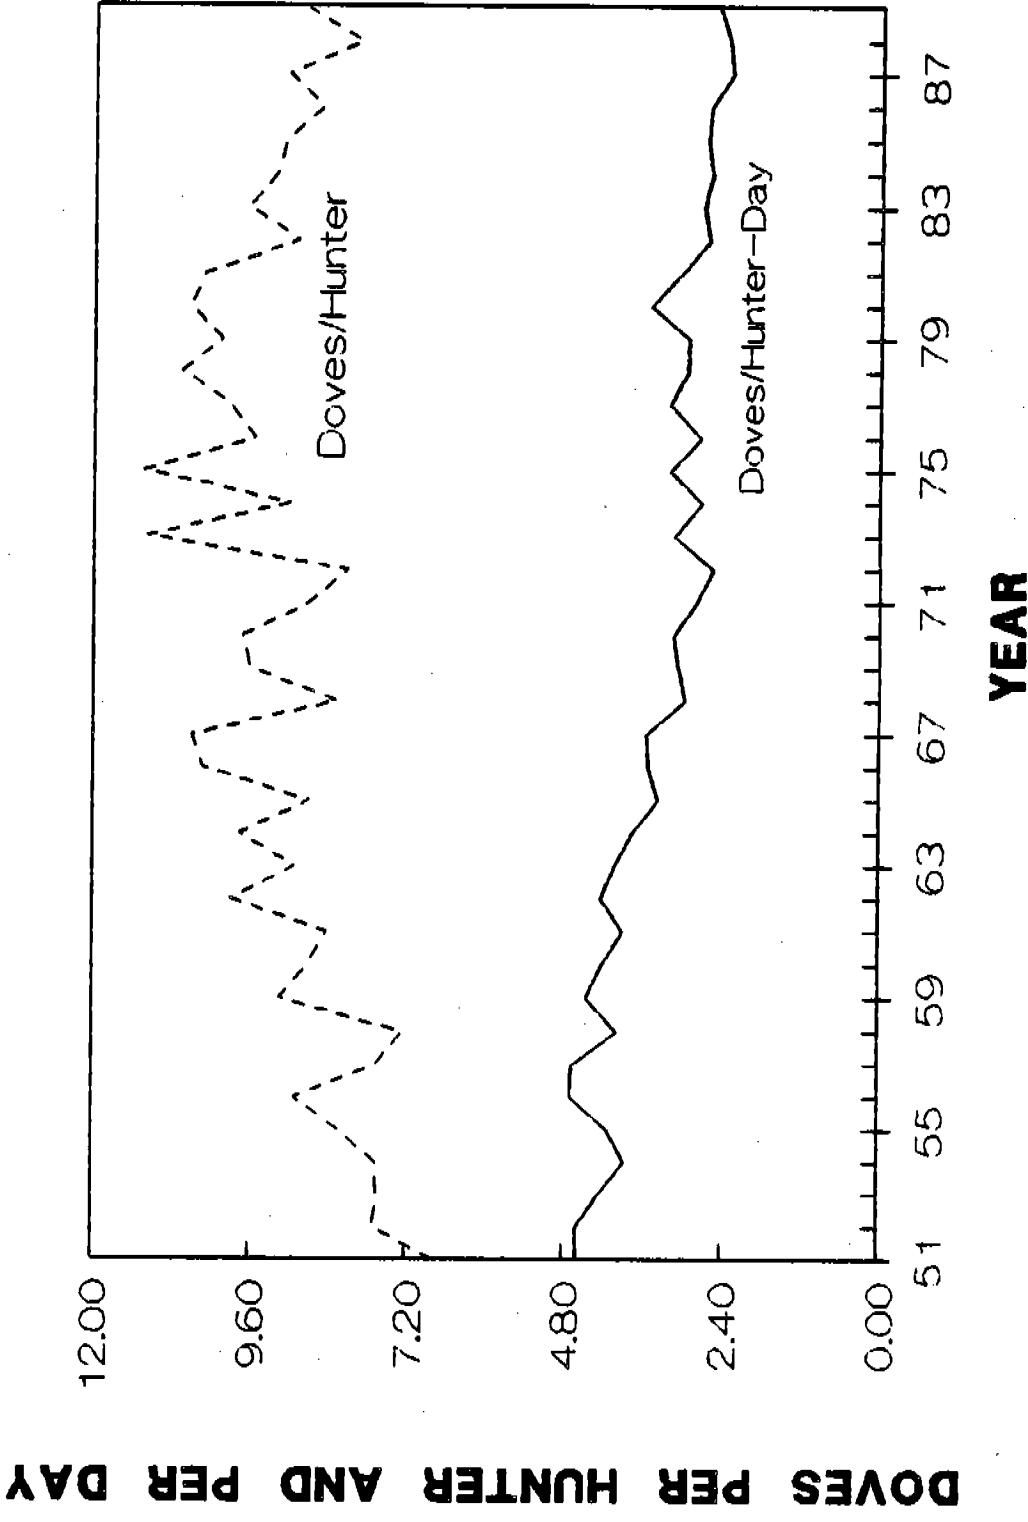

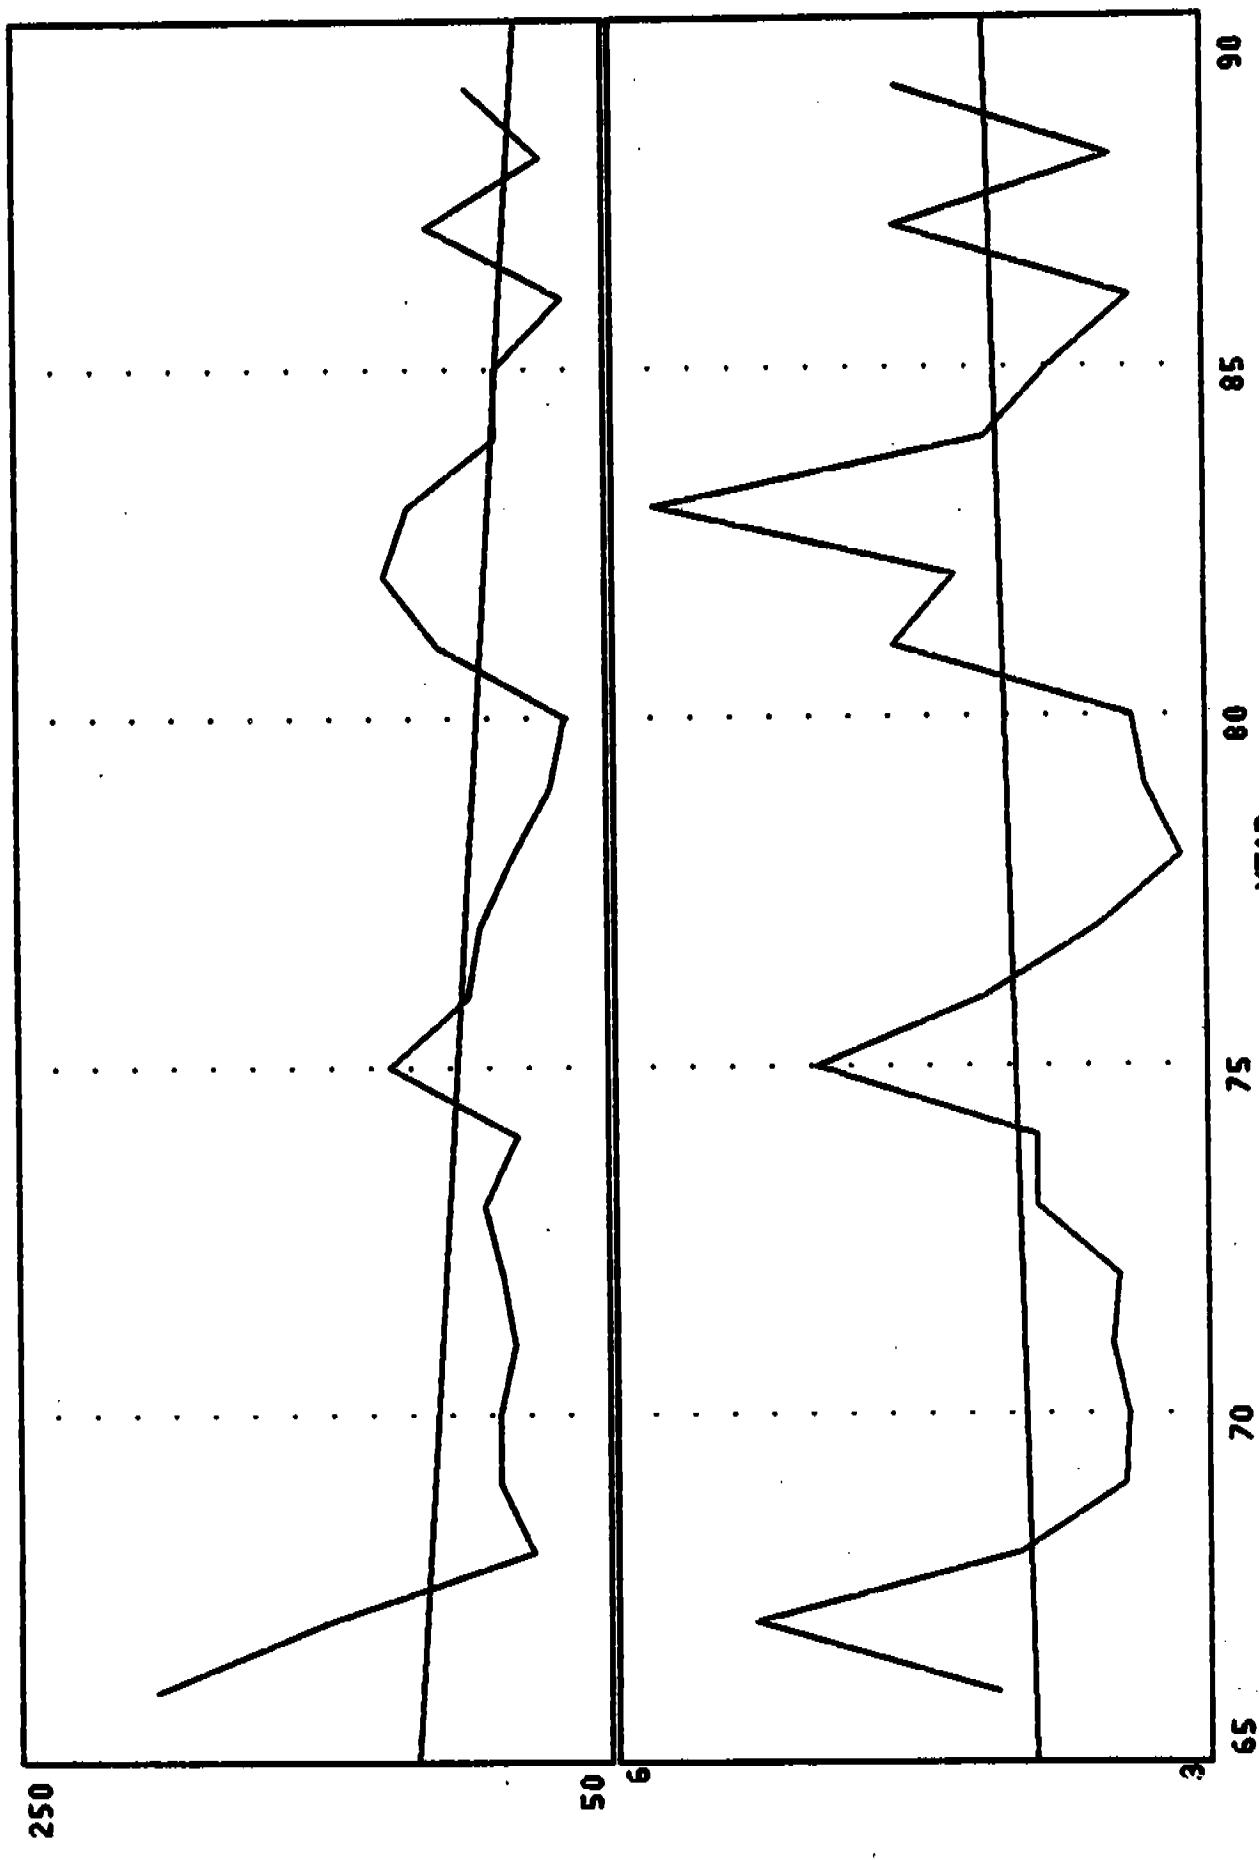

Figure 3. Statewide trends of mourning dove hunter success rates, 1951-89.

- 36 -

DOV/HNTR

Figure 4. Statewide dove field bag check indices, 1966-89.

hunter-days afield and doves per hunter-day were significantly below the 10-year average. Increased success seemed to be due to reduced hunter participation. May through August were dryer and warmer than normal. Precipitation in August was below normal in major dove concentration areas. On the 25th of August temperatures dropped below freezing at numerous locations but daily minimum temperatures were rarely below 40°F in major dove concentration areas.

Long-term harvest trends are depicted in Figure 2.

Field Bag Checks

A summary of field bag check data for 1989 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1989 survey compared to 1988 and the 10-year average (1979-88) follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total hunters checked	1,633	+39	-26
Total hours hunted	6,074	+33	-28
Doves per hunter (complete hunts)	4.31	+41	+14
Doves bagged per 100 hours	110	+67	+29
Average hours per hunter-day (complete hunts)	3.9	-9	-6
Hours hunted per dove bagged	1.0	-29	-11

September 1, 1989 was a Friday. Hunt conditions were good on opening day and weekend with dry and warm weather. Hunter participation should have been about the same as last year's Thursday opening. Field bag checks indicated an increase in hunter success. This agrees with the questionnaire results which also indicated a slight increase in hunter success. The total number of hunters checked was up 39 percent from 1988. Dove hunters spent less time afield per hunter-day than in 1988, and less time was spent per dove bagged, according to field bag check data.

Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1980 through 1989 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region since 1980 are shown in Table 11. Hatching dates for immature doves harvested in Utah in 1989 are shown in Table 12.

Following is a comparison of data collected in 1989 to 1988 and long-term averages (1966-88):

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Sample size	881	-46	-73
Immatures/100 adults	77	-23	-34
Percent of immatures hatched on: (N. Region)			
August 3 or later	41.3	--	--
July 25 or later	89.8	--	--
Before July 25	10.2	--	--

Sample size was down by half. The 77 immatures per 100 adults in the harvest indicated lower production compared to the previous 23-year average.

BAND-TAILED PIGEON

Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

Harvest

Results of the 1988 and 1989 band-tailed pigeon harvest are in Table 13 and Table 14 respectively. Permits were required in both 1988 and 1989, and a questionnaire was sent to participants. Only 29 hunters purchased the \$2.00 band-tailed pigeon permit in 1988 and 41 in 1989. Harvest trends since 1970 are shown in Table 15.

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Band-tailed pigeon hunters	23	+109	-56
Band-tailed pigeon harvest	24	-76	-83
Hunter-days afield	159	+46	+14
Pigeons per hunter-day	0.15	-84	-86
Pigeons per hunter	1.0	-89	-66

Total harvest and hunter success decreased in 1989 and was well below average. The majority of the 1989 harvest occurred in Utah County which may indicate misidentification.

CHUKAR PARTRIDGE

SUMMARY

The statewide breeding population of chukars decreased in 1989 following a colder than normal winter in northwestern Utah. Late winter and early spring precipitation, critical to successful chukar production, was below average.

Results of the brood survey indicated that brood production was below average. However, dry and hot weather in May through July may have adversely affected brood survival. Chukar density decreased during 1989, and was about average.

Harvest statistics from mail questionnaires reflected a decrease in harvest. Hunter success (chukars per hunter-day) decreased 15 percent from 1988. Chukar hunters and time afield were virtually the same as the year before. Hunting success on opening weekend as measured by field bag checks indicated decreased hunter success.

Brood Counts

Results of the annual random brood survey for 1989 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4 and Figure 1.

Following are the survey results for 1989 compared to 1988 and the 10-year (1979-88) average:

	<u>1989</u>	<u>Percent change from</u>	
		<u>1988</u>	<u>Average</u>
Total chukars observed	350	-65	-53
Young per 100 adults	327	-34	-24
Mean brood size	5.65	-29	-33
Chukars observed per 100 hours	522	-46	+1
Total hours effort	67	-36	-57

Harvest data for 1988 indicated breeding populations for 1989 were still significantly below statewide averages. The 1988-89 winter weather was reasonably mild with below average precipitation but below normal temperatures statewide. Late winter and early spring precipitation (January-April) was below average over the entire state (Figure 4). However, above average temperatures and below normal precipitation were common through the remainder of the year.

Effort on chukar brood counts decreased again in 1989 and remained below average.

Brood count sample sizes were again small for all regions. The Central Region counted 11, the Northern Region counted 2, and the Southern Region counted 2 of the state total of 17 broods. Chukar density was at the 10-year average and production was down from 1988.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire survey for 1989 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9 and Figure 2 and 3. Following is a comparison of 1989 harvest statistics to 1988 and the 30-year average:

	<u>1989</u>	<u>Percent change from</u>	
		<u>1988</u>	<u>Average</u>
Chukar hunters	10,910	-3	-24
Chukars harvested	27,628	-14	-32
Hunter-days afield	40,384	+7	-2
Chukars per hunter-day	0.68	-15	-26
Chukars per hunter	2.53	-11	-8

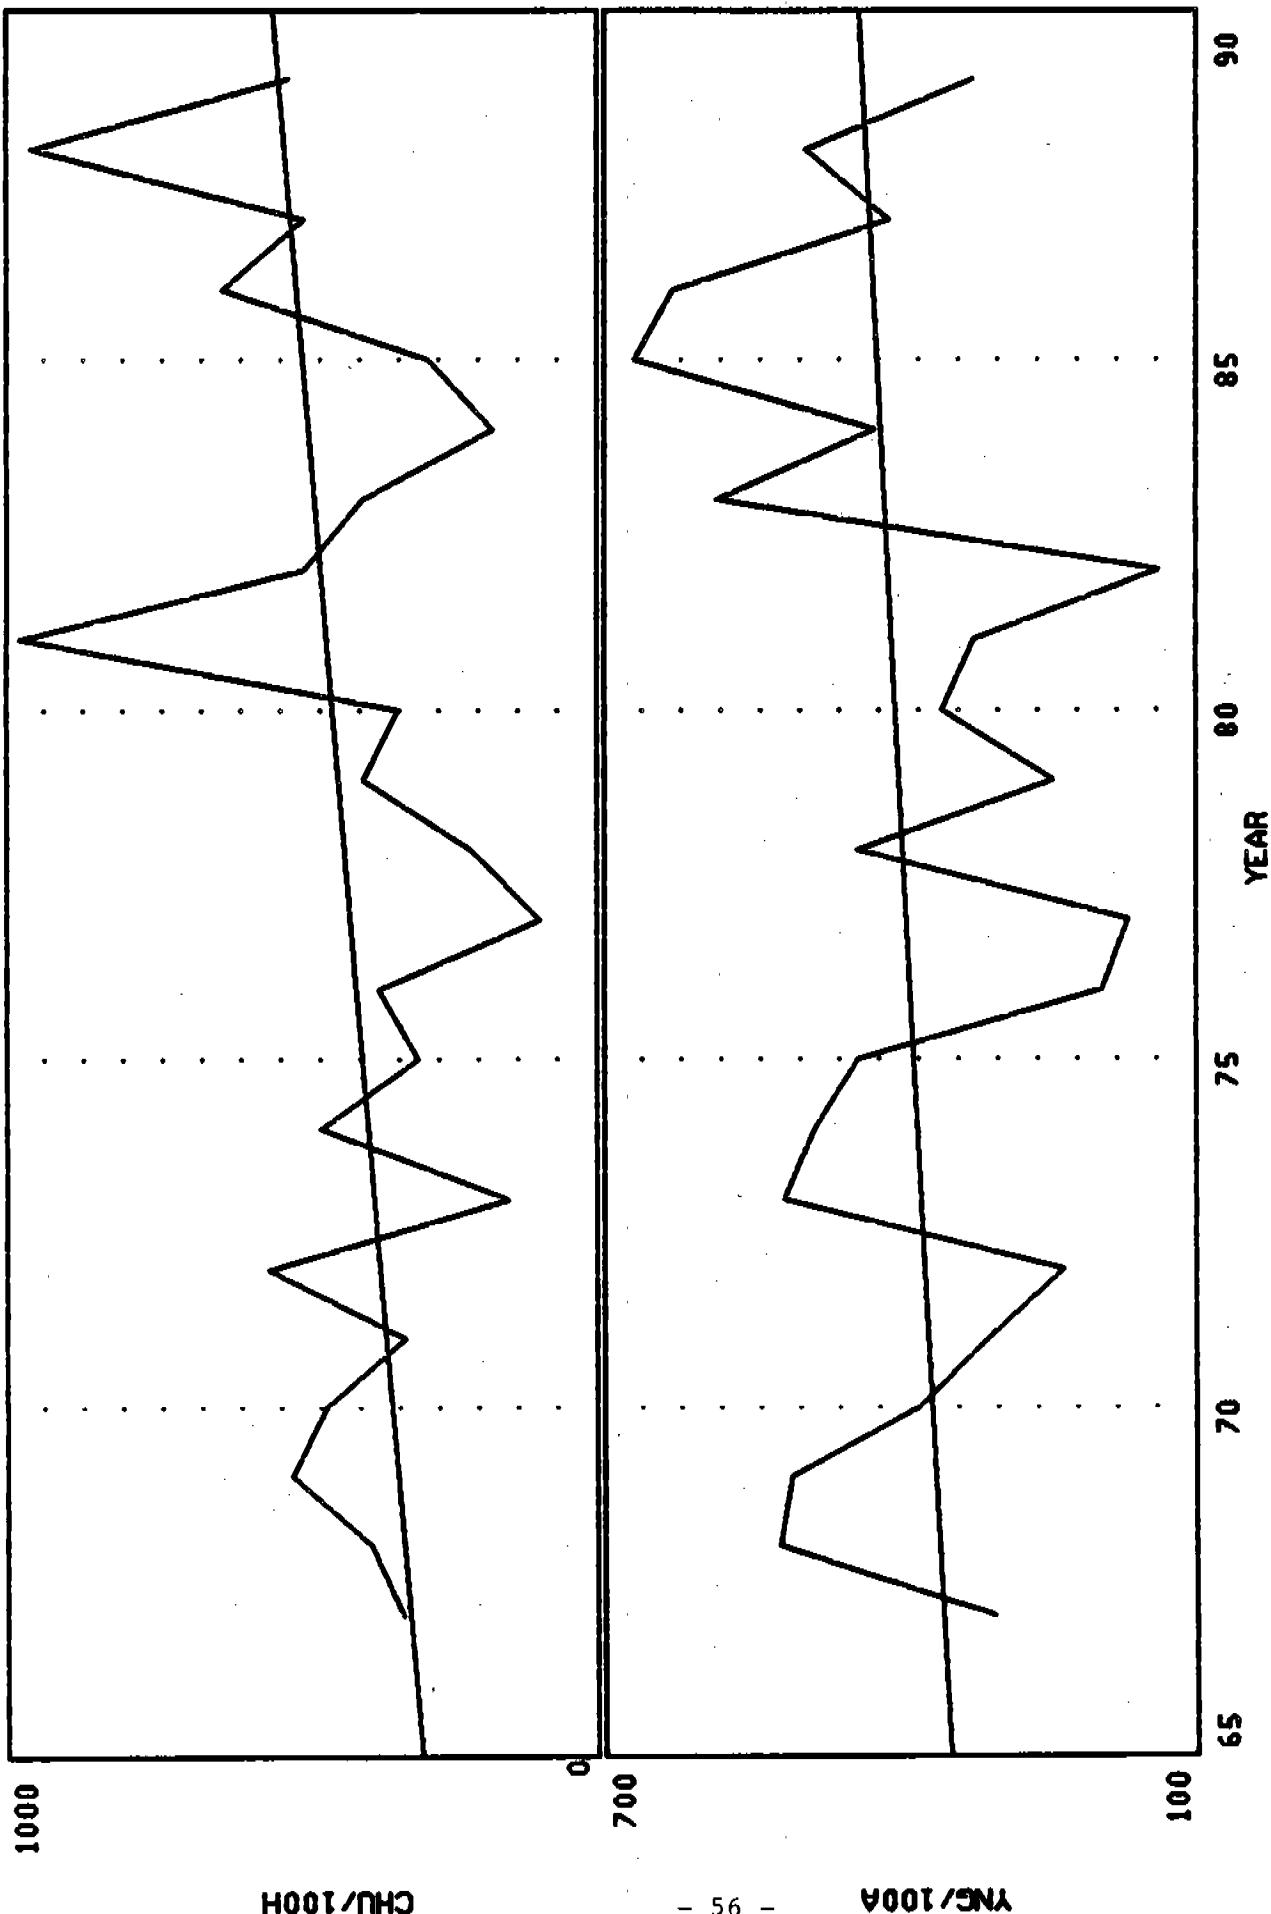

Figure 1. Statewide chukar production indices, 1967-89.

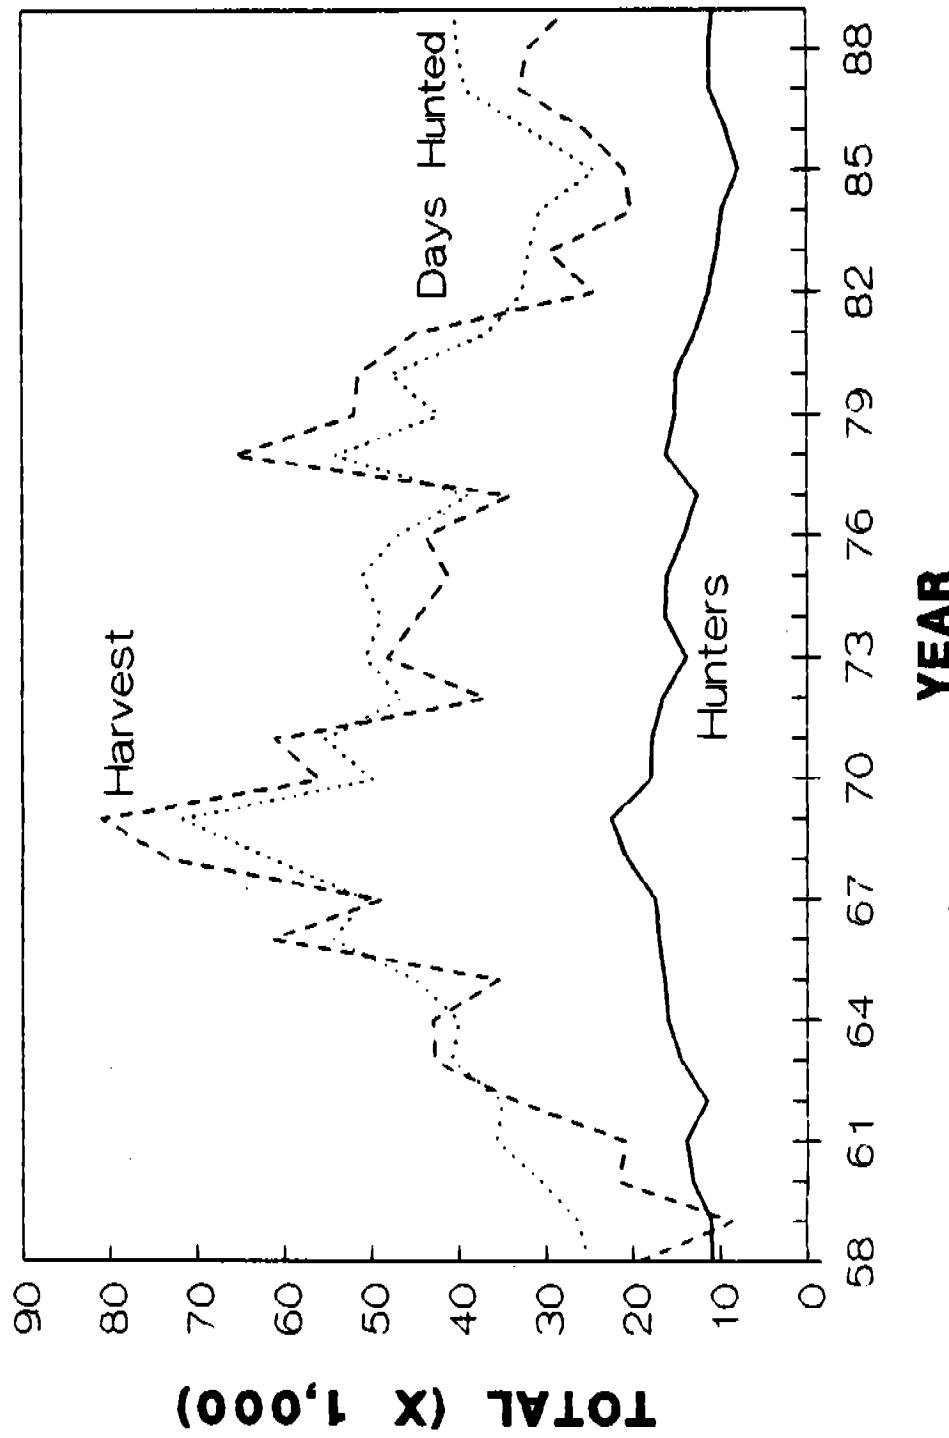

Figure 2. Statewide trends of chukar partridge harvest statistics, 1958-89.

CHUKARS PER HUNTER AND DAY

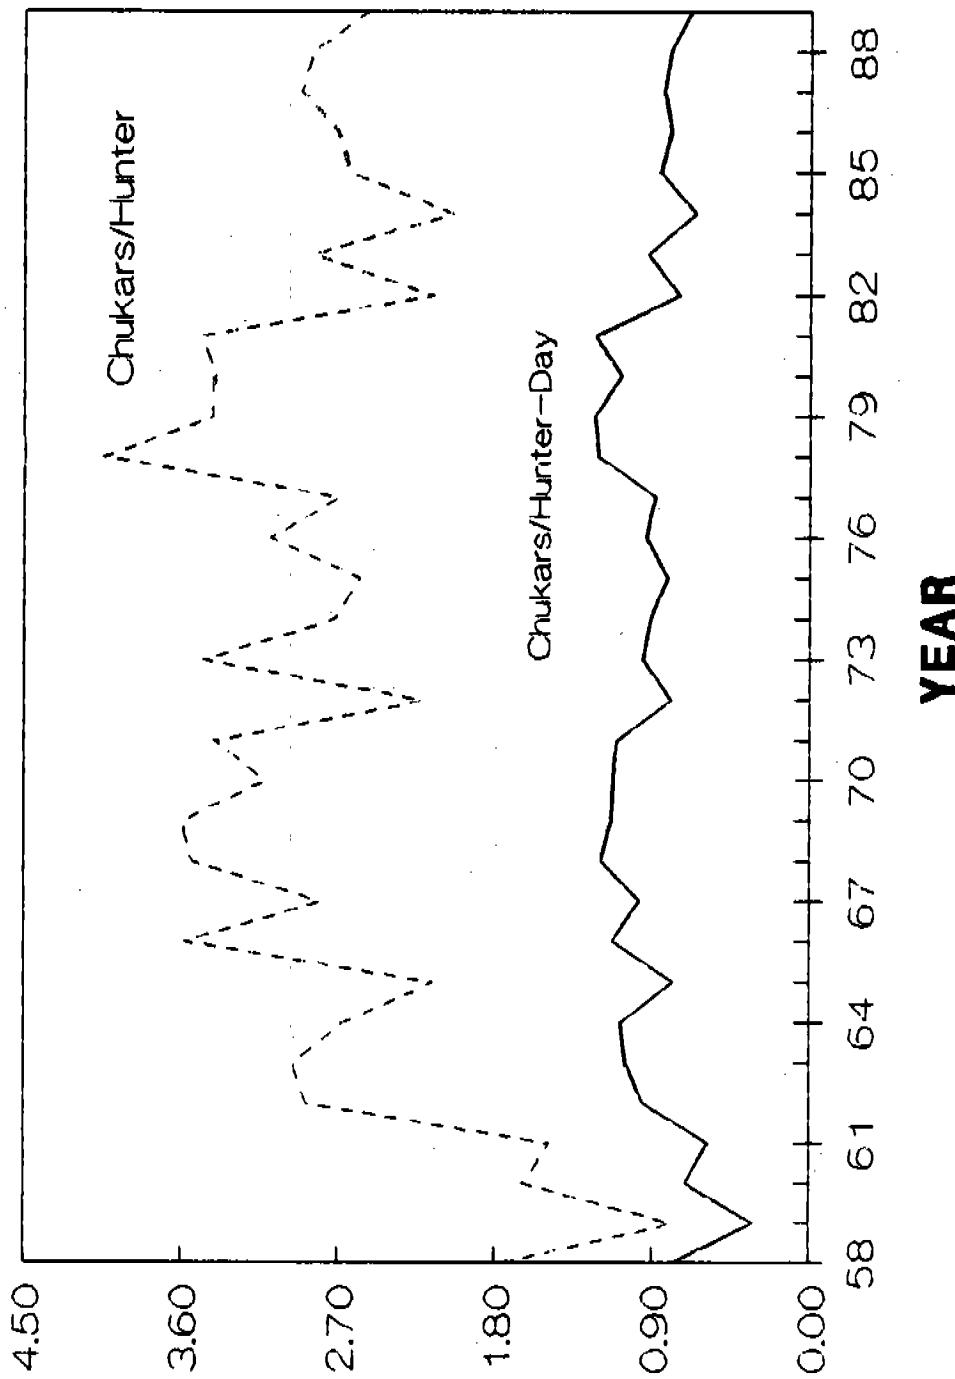

Figure 3. Statewide trends of chukar hunter success rates, 1958-89.

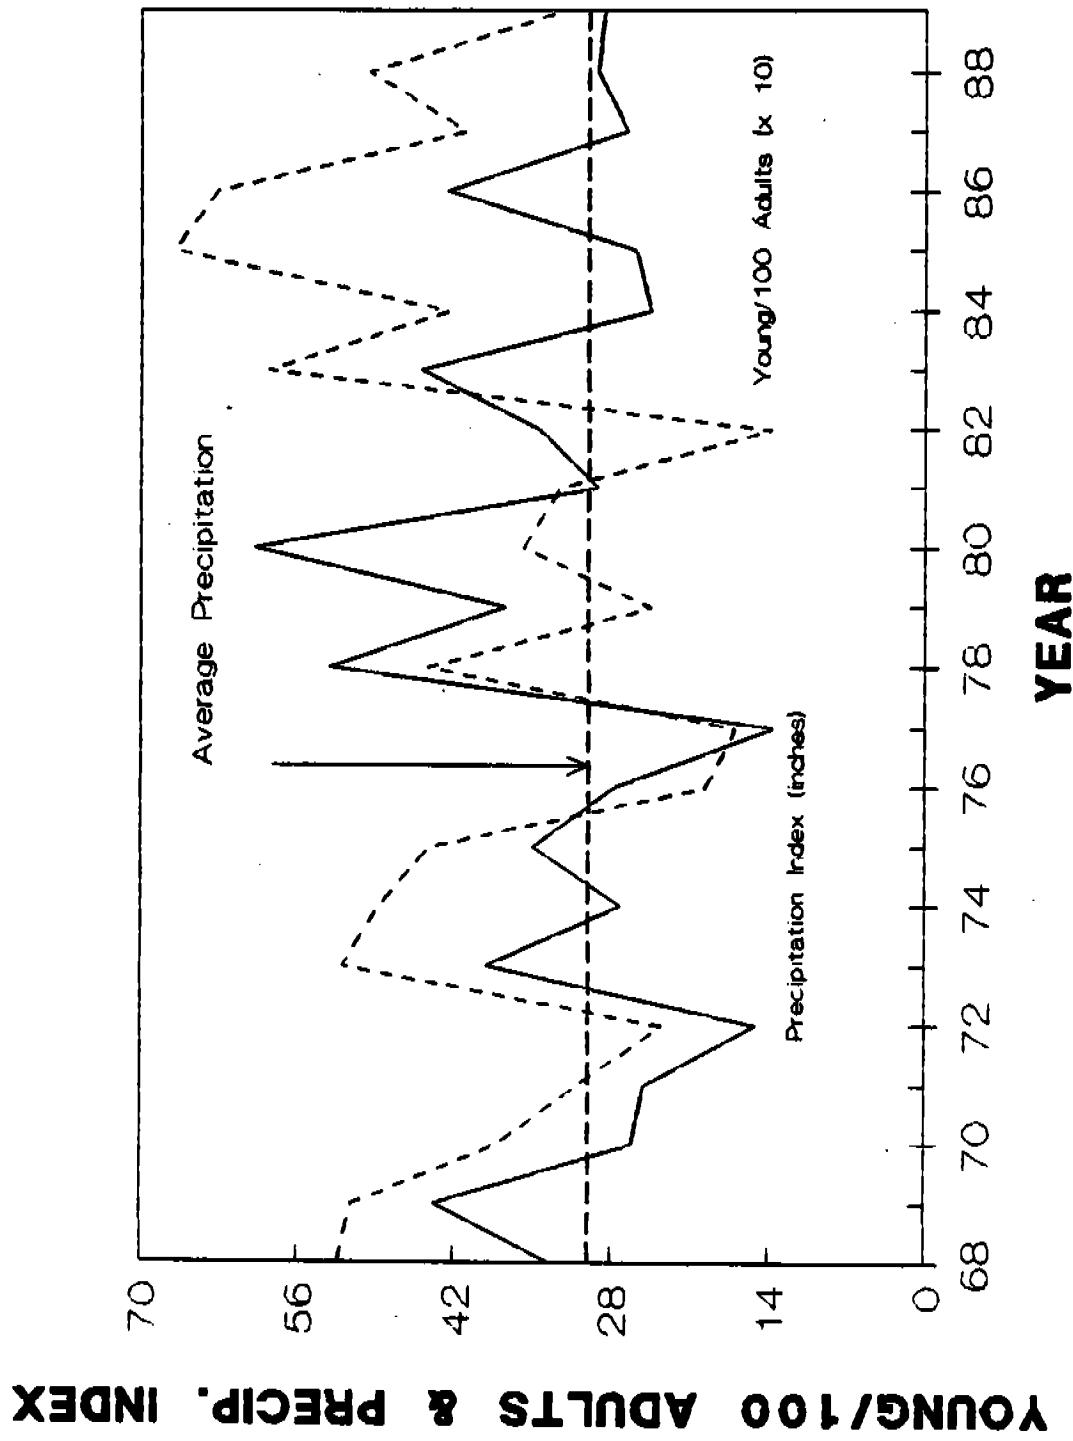

Figure 4. Relationship between late winter and early spring (Jan.-April) precipitation and chukar production.

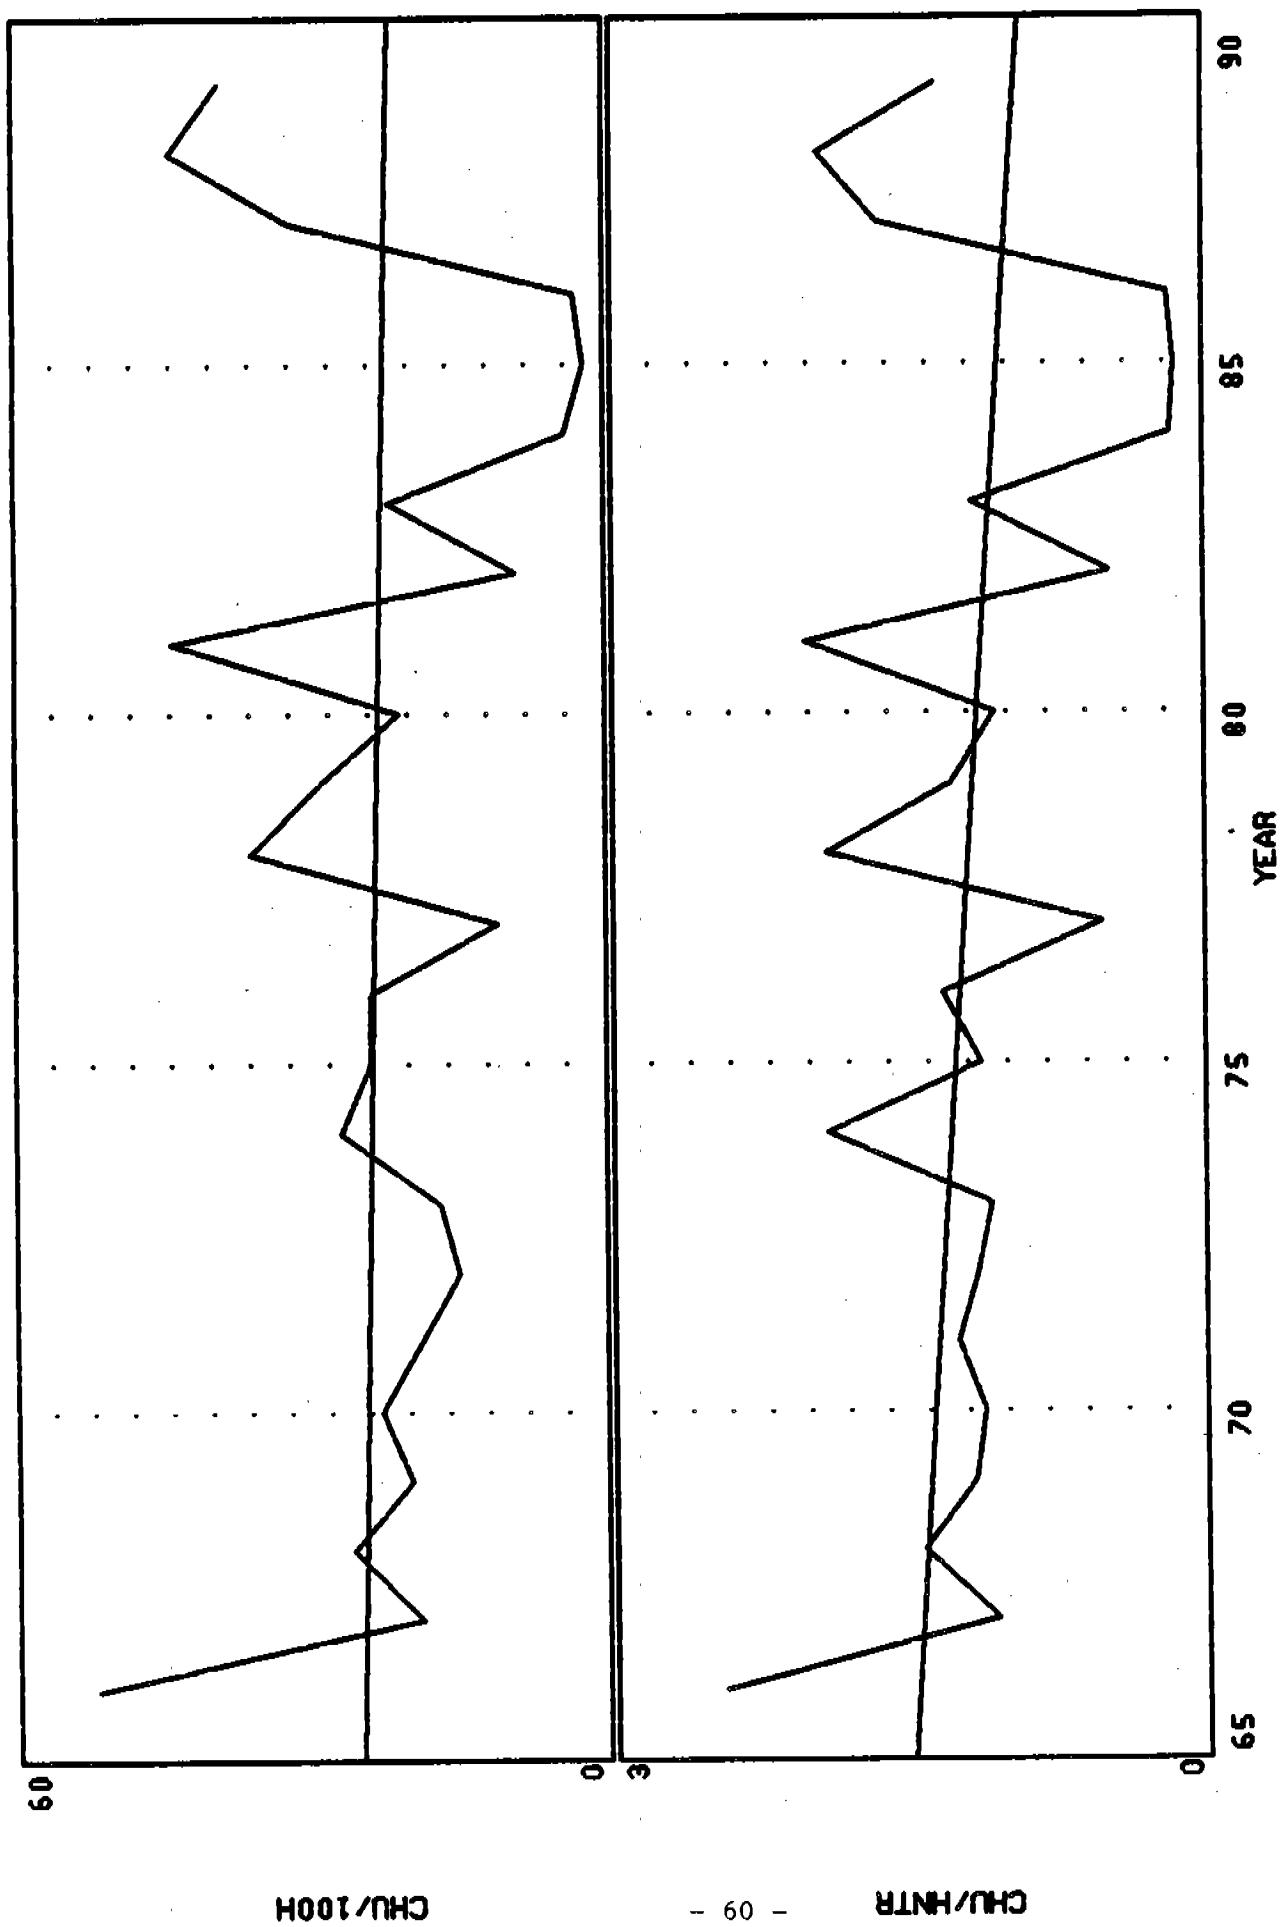

Figure 5. Statewide chukar field bag check indices, 1967-89.

Chukar hunters and hunter effort were virtually the same as last year. Chukars per hunter-day declined 15 percent and was 26 percent below the statewide average. Total harvest declined 14 percent. The Central Region again had the highest percentage of the harvest (53%) in 1989, and also had the highest percentage of hunter pressure (47%).

Field Bag Check

A summary of field bag check data for 1989 is shown in Table 10. The hunter success trend determined by field bag checks since 1983 is shown in Table 11 and Figure 5. Data for the 1989 season compared to 1988 and the (1966-88) average follow:

	<u>1989</u>	<u>Percent change from</u>	<u>1988</u>	<u>Average</u>
Total hunters checked	42	-70	-85	
Total hours hunted	146	-68	-89	
Chukars per hunter (complete hunts)	1.13	-31	+34	
Chukars bagged per 100 hours	39	-11	+83	
Average hours per hunter-day (complete hunts)	2.9	-22	-35	
Hours hunted per chukar bagged (complete hunts)	2.6	+13	-83	

Field bag checks indicated hunter success on opening weekend was down from 1988 but was above average (34%). However, sample sizes were extremely small.

SAGE GROUSE

SUMMARY

Harvest data for 1988 indicated average breeding populations of sage grouse for 1989. Strutting ground surveys indicated a decrease in the average male grouse attendance from 1988 and populations were below average.

Brood surveys showed decreased production throughout the state. Birds observed per 100 hours decreased 17 percent compared to 1988, and was 20 percent below average. The ratio of young to adults remained the same as 1988 but was slightly below average.

The decrease in production, as indicated from brood counts, in 1989, was somewhat apparent in harvest statistics collected from questionnaires and from field bag checks. Hunter success rates declined. However, hunters and days hunted were similar to 1988. Harvest was at the 36-year average. Age ratios derived from wings indicated a 14 percent decrease in young per 100 adults and was 35 percent below average.

Strutting Ground Counts

The status of the sage grouse breeding population for 1989, as indicated by strutting ground counts, is shown in Table 1 and Figure 1 of this section. Results of this survey for 1989 compared to 1988 and the 1967-88 average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Number of grounds counted	119	-13	+9
Total male grouse counted	2,041	-25	-1
Average male grouse per ground	17	-15	-10
Percent change from previous year (comparable grounds)	-14	--	--

Access for spring 1989 strutting ground counts was generally good in most regions of the state. The numbers of male grouse observed decreased statewide. Harvest data for 1988 indicated below average populations going into the winter of 1988-89, but the numbers of juvenile birds observed during the summer indicated production similar to 1988. Loss of habitat continues to be the trend in most areas of the state. Notable examples are concessions made by the Soil Conservation Commission for the use of public funds for 90% removal of sagebrush within two miles of the Clover strutting ground, Tooele County.

Brood Counts

Results of the summer inventory survey for 1989 are found in Table 2. Long-term trends of young-adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5 and Figure 2. Indices for 1989 are compared to 1988 and the previous 10-year (1979-88) average as follows:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total sage grouse counted	772	-50	-59
Young per 100 adults	147	+1	-5
Mean brood size	4.37	+2	-2
Sage grouse observed per 100 hours	288	-17	-20
Total hours effort	268	-39	-47

The effort devoted to sage grouse brood counts was 47 percent below average, and the total number of grouse counted was 59 percent below average.

Sage grouse density decreased 17 percent from 1988, production of young per 100 adults remained the same. The average brood size was at the 10-year average. Drought conditions March through June may have negatively influenced brood survival or caused an earlier dispersal of broods.

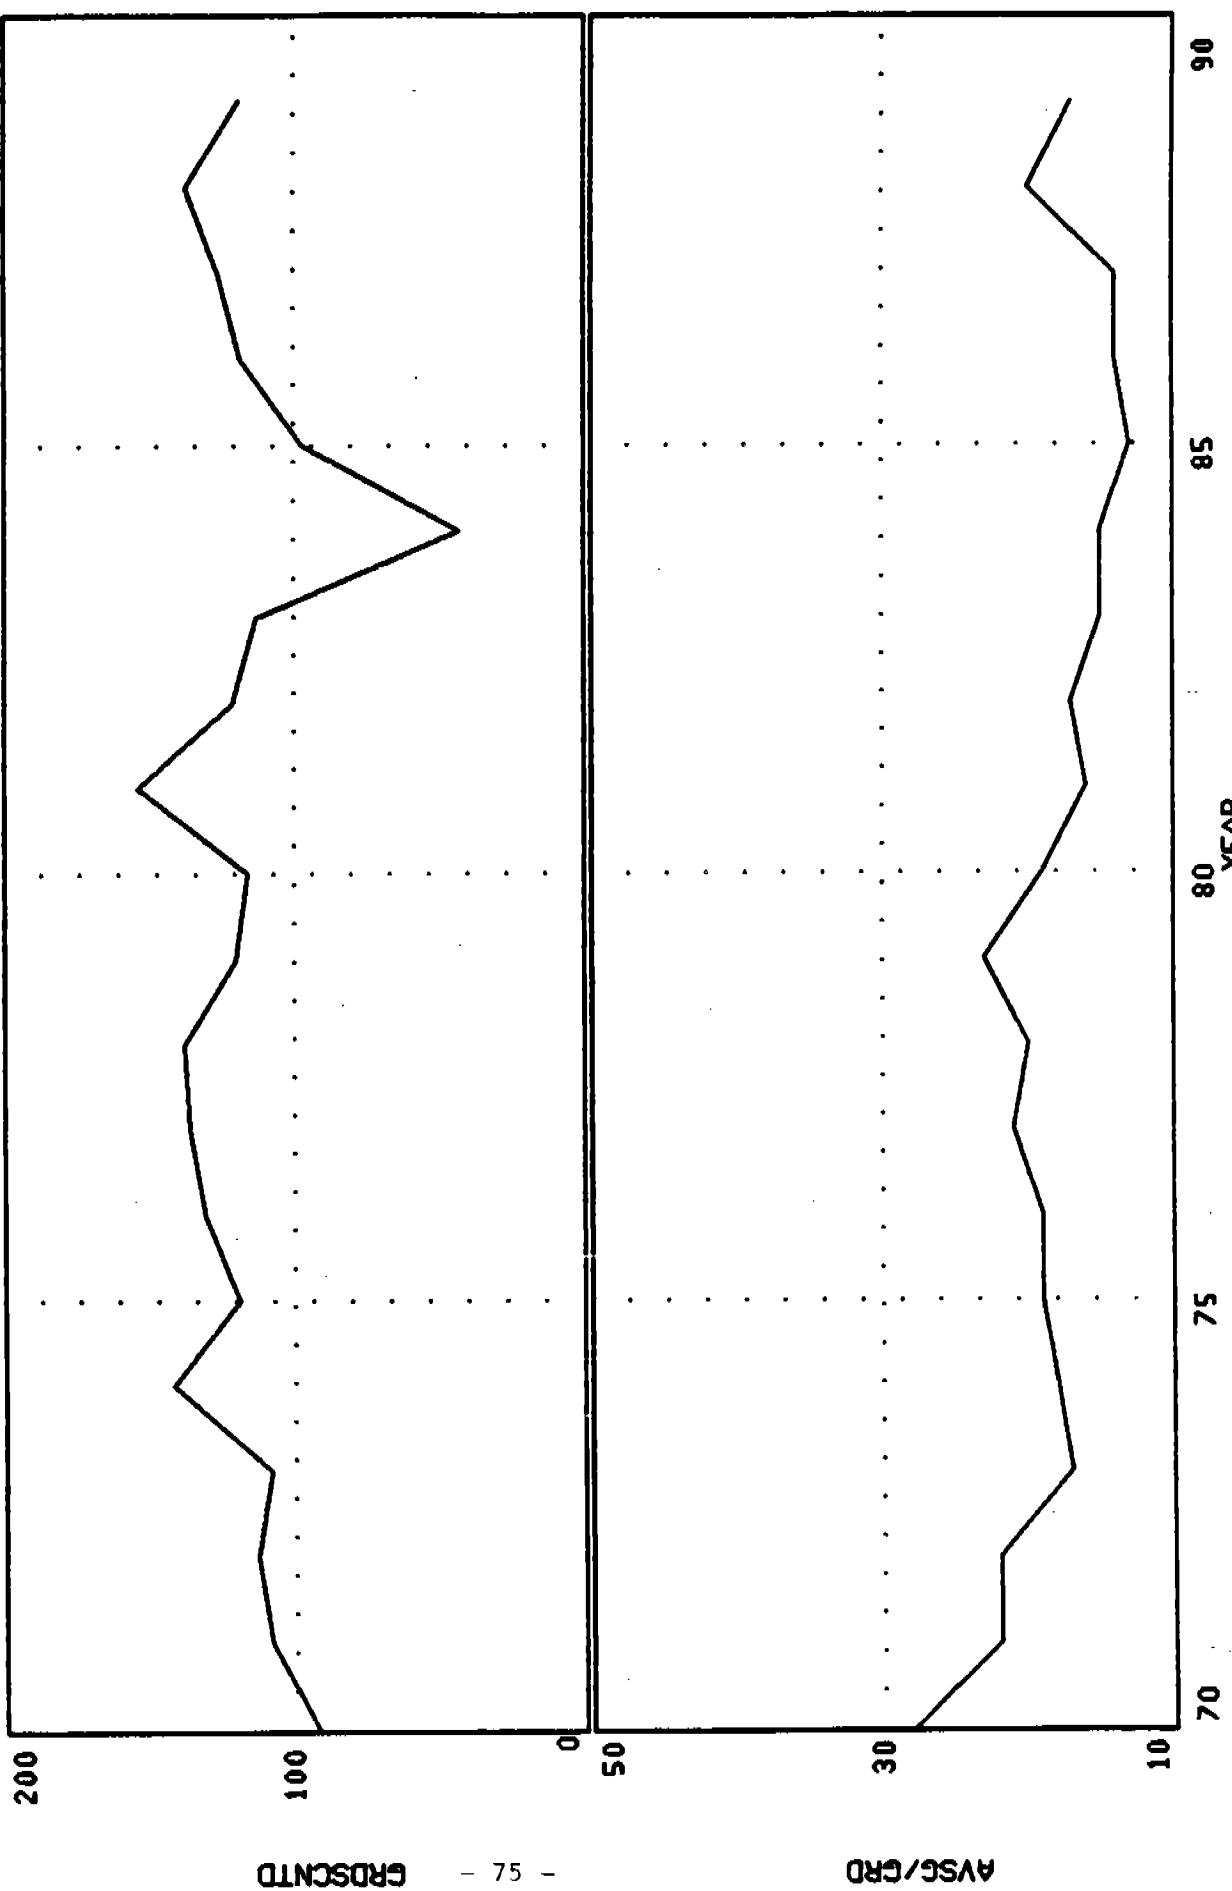

Figure 1. Statewide sage grouse strutting ground counts, 1970-89.

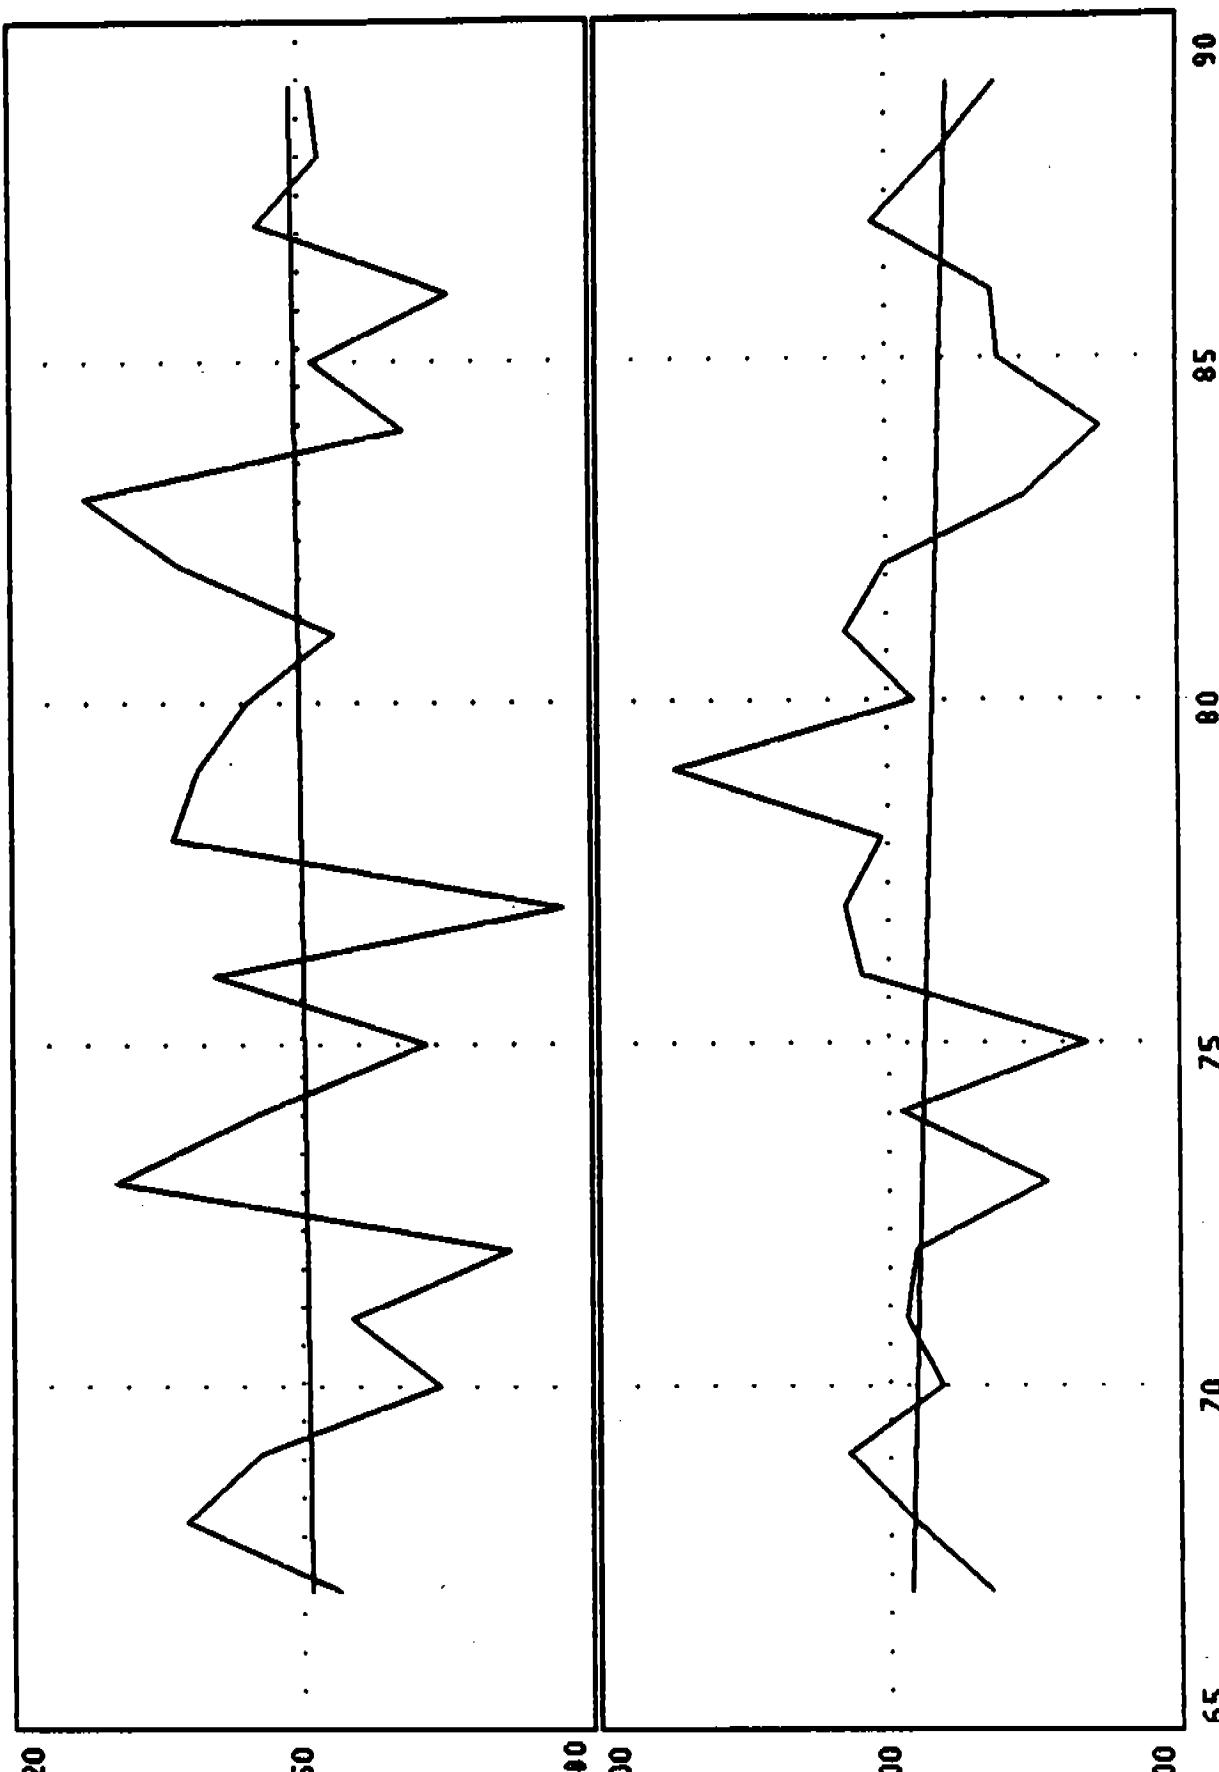

Figure 2. Statewide sage grouse production indices, 1967-89.

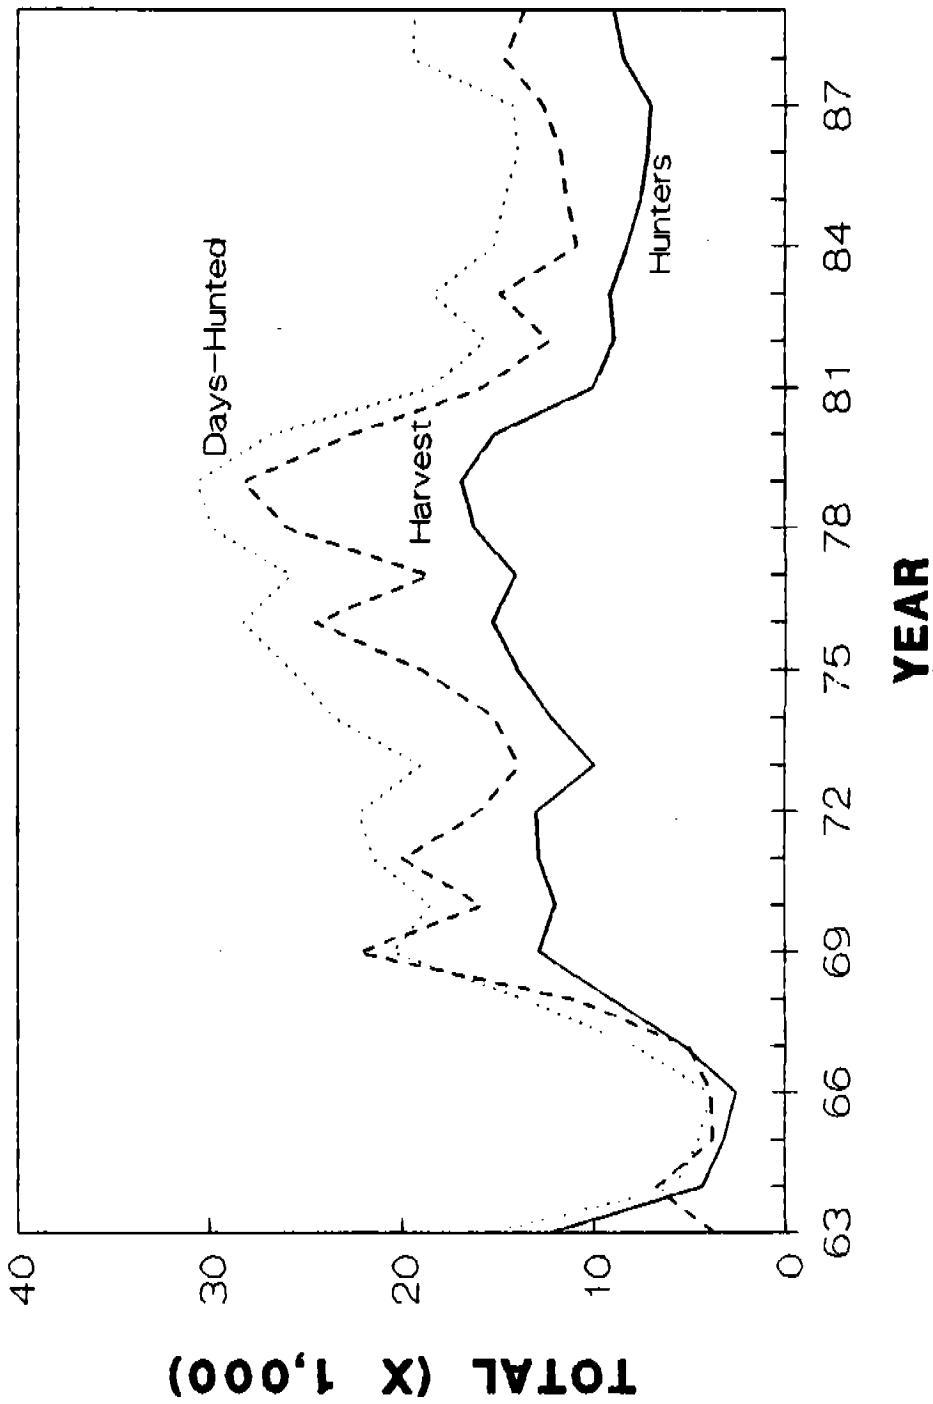

Figure 3. Statewide trend of sage grouse harvest statistics, 1963-89.

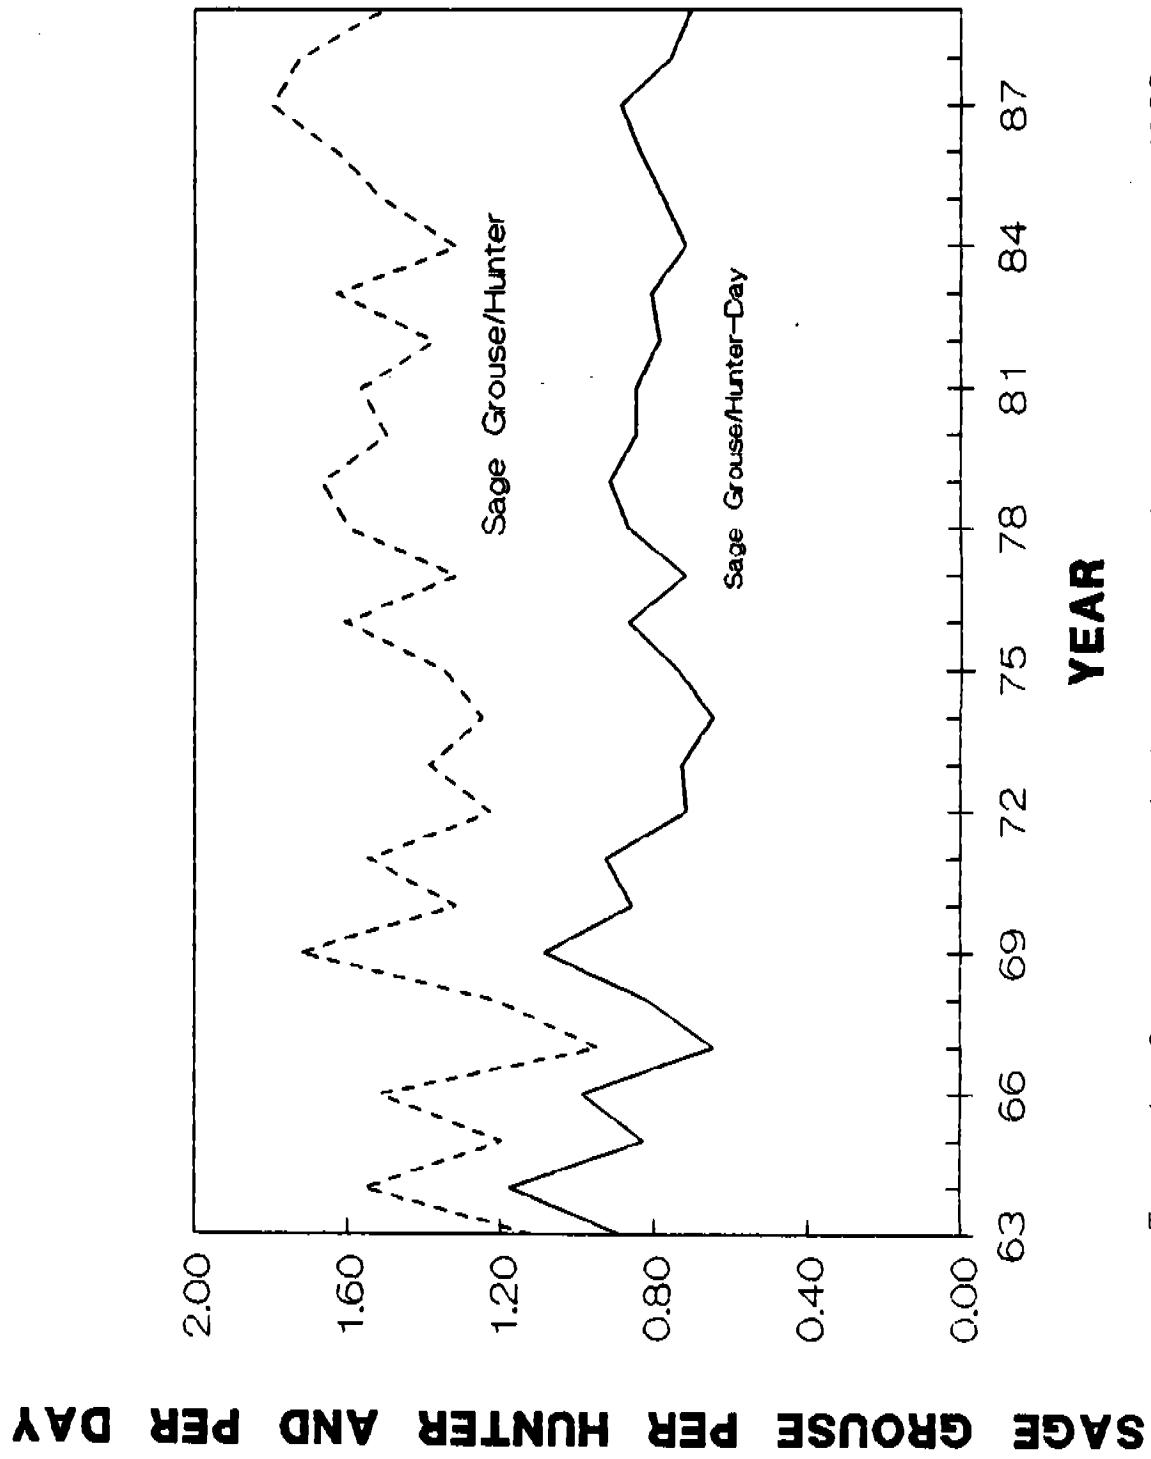

Figure 4. Statewide trend of sage grouse hunter success rates, 1963-89.

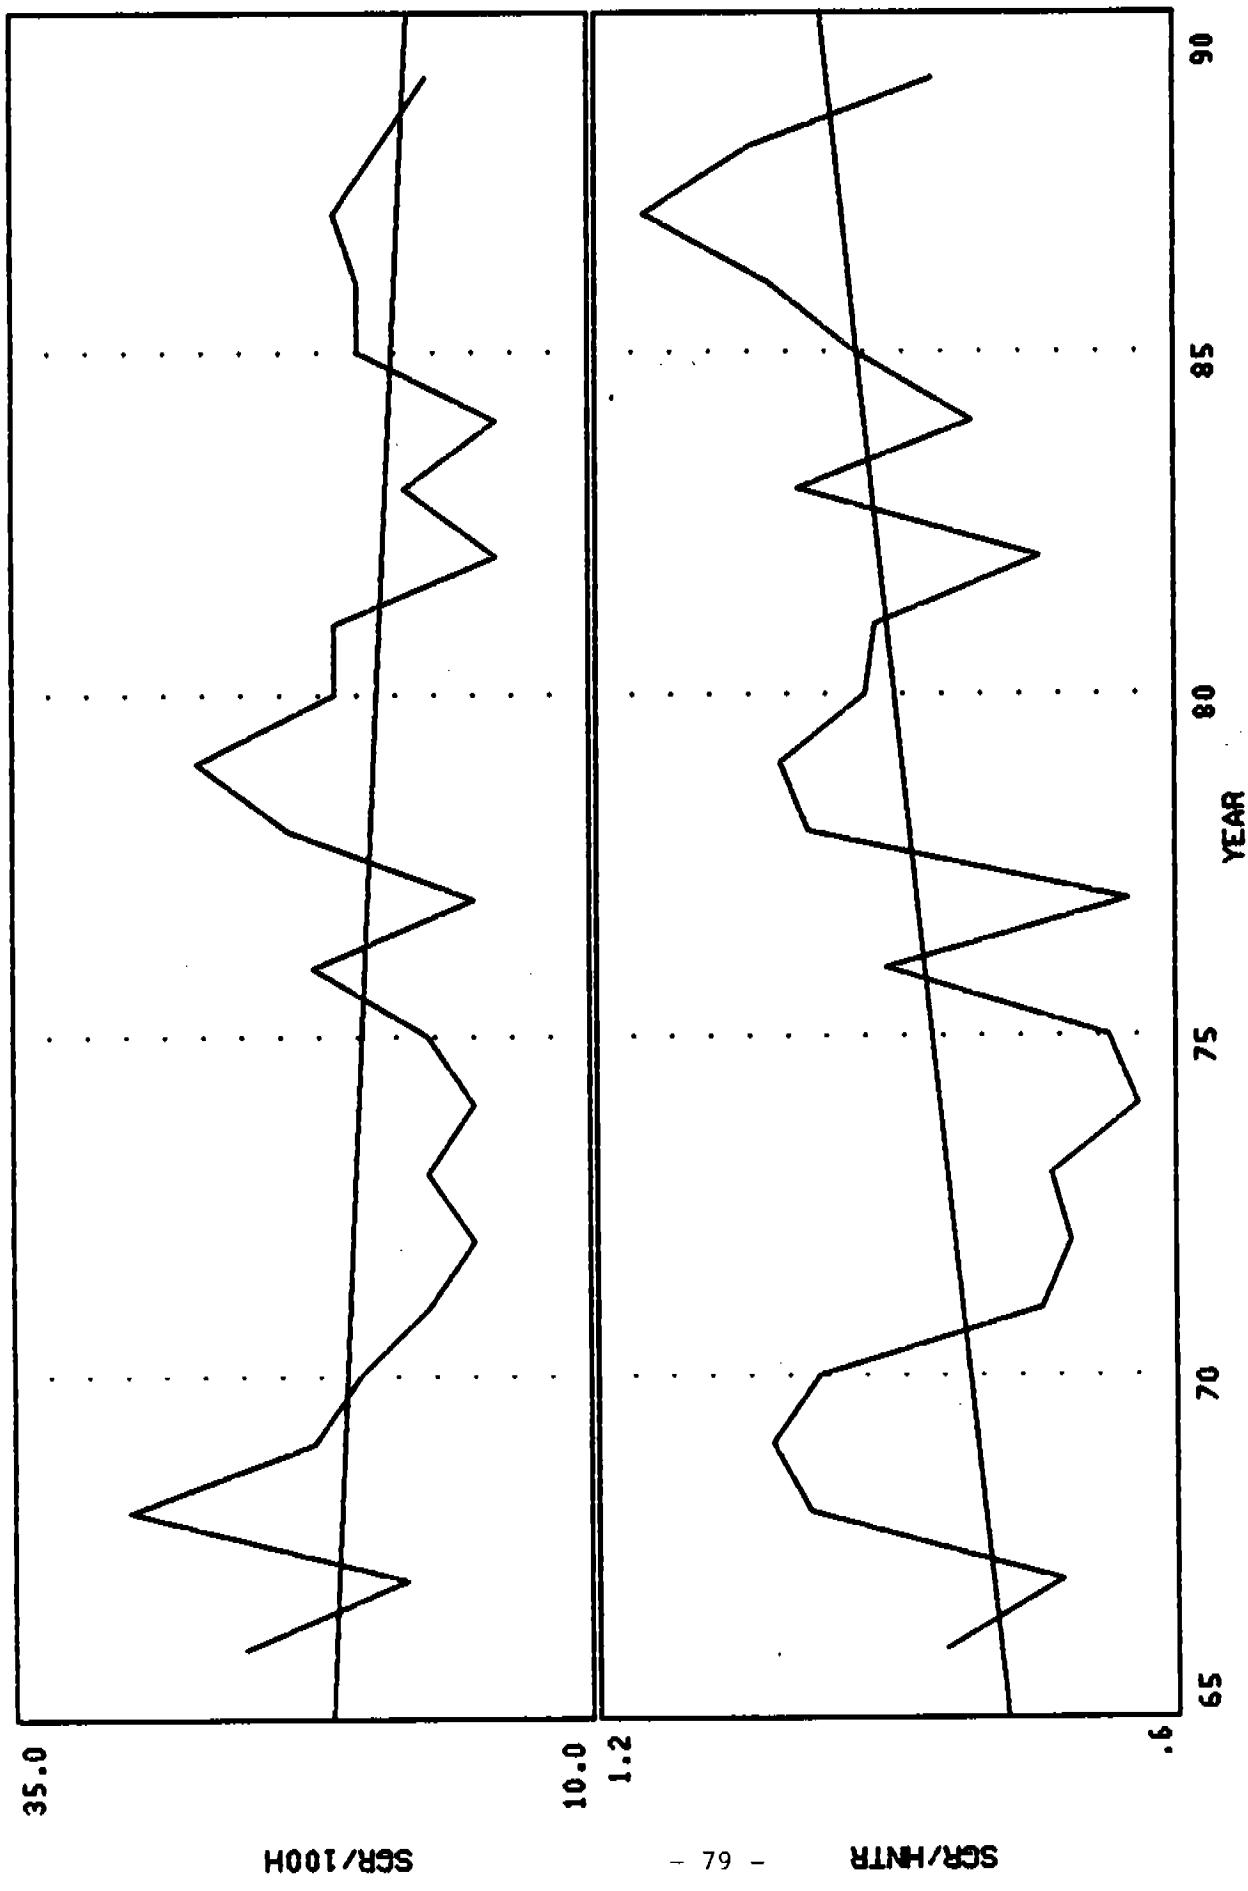

Figure 5. Statewide sage grouse field bag check indices, 1966-89.

Harvest

Hunter Questionnaire

Results of the 1989 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1989 hunting season compared to 1988 and the 1963-88 average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Sage grouse hunters	9,002	+6	-10
Sage grouse harvested	13,710	-7	-3
Hunter-days afield	19,373	0	+15
Sage grouse per hunter-day	0.71	-7	-12
Sage grouse per hunter	1.52	-12	+9

Sage grouse per hunter-day success rates decreased 7 percent in 1989. Total statewide harvest decreased 7 percent, and total sage grouse hunters increased 6 percent. Hunter success increased 5 percent in the Northern Region where five of the seven counties were closed to sage grouse hunting. Nevertheless, 43 percent of the harvest and 45 percent of the hunting pressure still occurred in the Northern region.

Long-term sage grouse harvest trends are shown in Figures 3 and 4.

Field Bag Checks

A summary of field bag check data for 1989 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12 and Figure 5. Results of the 1989 survey compared to 1988 and the 1979-88 average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Total hunters checked	1,356	+23	-4
Total hours hunted	5,649	+11	-11
Sage grouse per hunter (complete hunts)	0.85	-18	-11
Sage grouse bagged per 100 hours	17	-6	-9
Average hours per hunter-day (complete hunts)	4.9	-9	-2
Hours hunted per grouse bagged (complete hunts)	5.8	+12	+7

Much of Utah was again dry with birds concentrated around available water. Hunter success rates from field bag checks were similar to mail questionnaire success rates. Both were down again last year but near the long term average.

Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1989 is found in Table 13 and the trend from 1986-89 in Table 14.

Following are data derived from wing surveys in 1989 compared to 1988 and the 1973-88 average:

	<u>1989</u>	<u>Percent change from</u>	
		<u>1988</u>	<u>Average</u>
Sample size	921	-2	-21
Percent males	35	+13	-16
Percent females	65	-6	+11
Young per 100 adults	98	-14	-35
Young per 100 hens (adult)	129	-22	-44

Analysis of wings collected at checking stations during the 1989 season indicates that statewide production was down compared to 1988, and was below the previous 16-year average.

SUMMARY

Judging from harvest statistics for the fall of 1988, the 1989 breeding populations of blue and ruffed grouse were higher than average. However, ruffed grouse observed per 100 hours of effort during summer brood counts in 1989 dropped 43 percent.

Production of blue grouse increased from 1988 but was below the 10-year average. However, blue grouse observed per 100 hours of effort dropped 51 percent from the previous year. A total of 46 forest grouse broods were observed during 1989 compared with 86 in 1988, 134 in 1987, 53 in 1986, and 78 in 1985.

Harvest statistics indicated decreased density of forest grouse. Total harvest decreased from 53,562 in 1988 to 45,487 in 1989, a 95 percent decrease. Total hunters and days afield remained the same. Field bag check data corroborated decreased forest grouse numbers from the questionnaire.

These data indicate that hunters are discovering forest grouse hunting and are using the resources more than 10 years ago. This is what we hoped to accomplish in the five-year strategic plan.

Brood Counts

Ruffed Grouse

Results of the annual random brood survey for 1989 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1989 compared to 1988 and the previous 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total ruffed grouse observed	49	-53	-63
Young per 100 adults	277	+73	-13
Mean brood size	3.30	-11	-26
Ruffed grouse observed per 100 hours	26	-43	-30
Total hours effort	187	-17	-58

Harvest statistics for 1988 indicated an above average breeding population for 1989.

Effort on brood surveys decreased by 17 percent and was 58 percent below average.

Grouse observed per 100 hours was 30 percent below average, while mean brood size was 26 percent below average indicating poor production.

Blue Grouse

Results of the annual random brood survey for 1989 are shown in Table 5 of this section. Long-term trends of young-adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1989 compared to 1988 and the 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total blue grouse observed	234	-49	-54
Young per 100 adults	225	+9	-5
Mean brood size	3.61	+12	-4
Blue grouse observed per 100 hours	81	-51	-24
Total hours effort (forest grouse)	289	+5	-44

Harvest statistics for 1988 indicated the blue grouse breeding population for 1989 was again above average.

The 1989 summer surveys on blue grouse indicated that production increased slightly (9 percent) from 1988 but was still below average.

This may have resulted from a dryer and warmer spring than normal statewide and above average temperatures and below average precipitation May through August 1989.

Total observations decreased 49 percent, without any decrease in effort. The number of grouse observed per 100 hours of effort decreased from 1988 and was 24 percent below average.

Harvest

Hunter Questionnaire

Results of the 1989 blue grouse, ruffed grouse and combined hunter questionnaire are shown in Table 10, 11 and 12 respectively. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 13-15 and total statewide harvest statistics in Table 16 and Figure 1 and 2. Forest grouse season length, bag limits and harvest statistics, 1963-1989 are listed in Table 17. Harvest statistics for 1989 compared to 1988 and the 26-year (1963-88) average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Forest grouse hunters	16,987	0	+20
Forest grouse harvested	45,487	-15	+58
Hunter-days afield	50,631	-2	+48
Forest grouse per hunter-day	0.90	-13	-8
Forest grouse per hunter	2.68	-15	+17
Percent ruffed grouse	35.9	+1	-6
Percent blue grouse	61.1	+4	+17
Percent unidentified	3.0	-44	-52

Results from the harvest questionnaire confirmed decreasing forest grouse populations in 1989. This decrease was in both blue and ruffed grouse. Ruffed grouse hunter success was 18 percent below average. Total harvest decreased 15 percent from 1988 but was 58 percent above average. Blue grouse hunter success was about average. Total harvest decreased 12 percent from 1988 but was 48 percent above average. Hunter success (grouse per hunter-day) was 8 percent below average, and the number of grouse harvested per hunter was 17 percent above average. Hunter pressure remained about the same as 1988, and was 48 percent above the 26-year average.

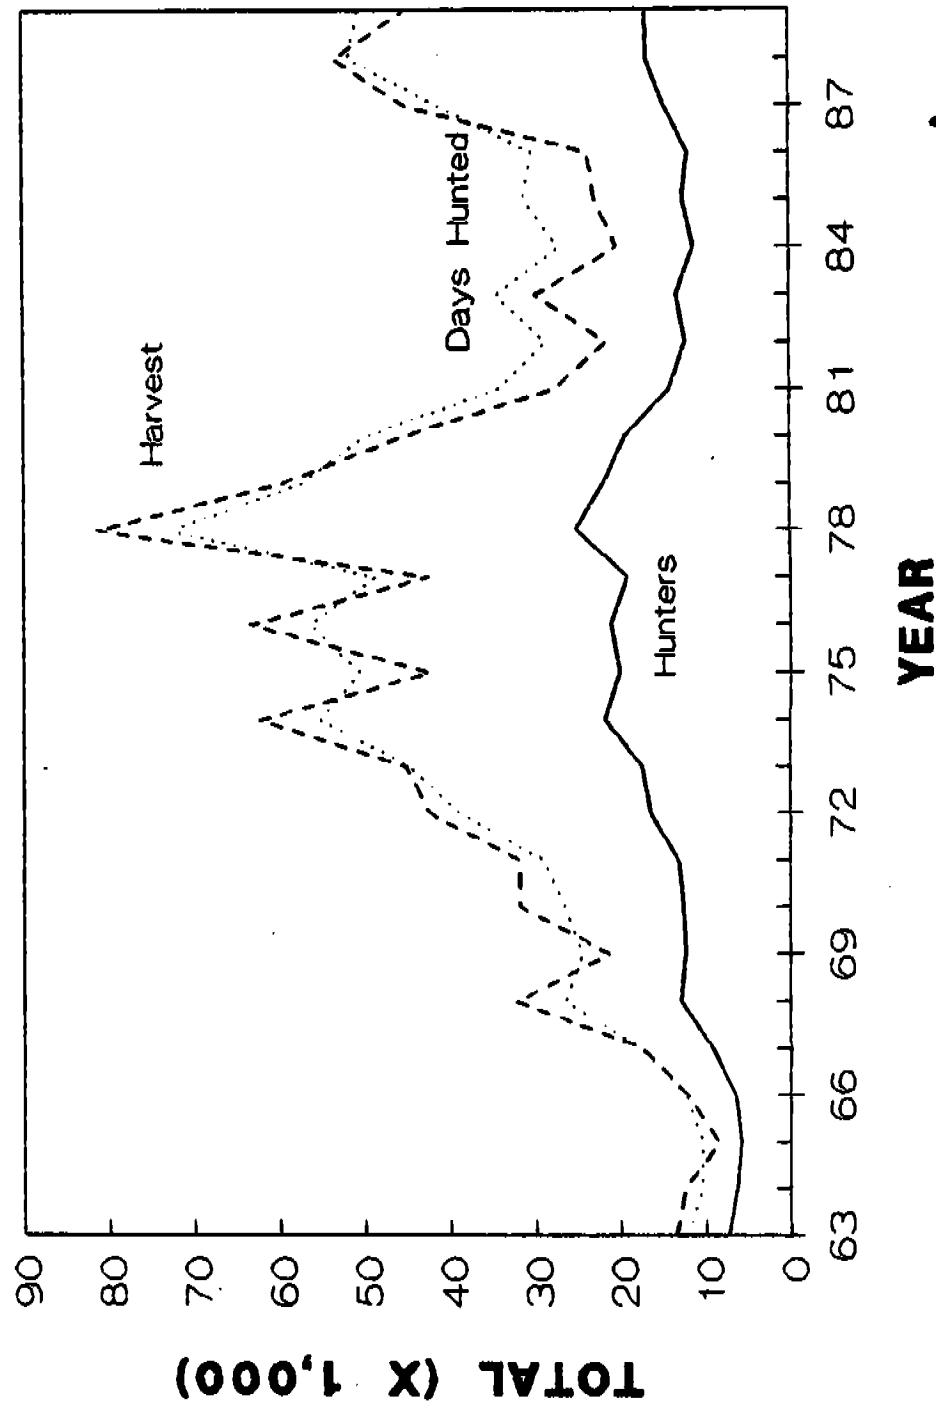

Figure 1. Statewide trends of forest grouse harvest statistics, 1963-89.

FOREST GROUSE PER HUNTER AND DAY

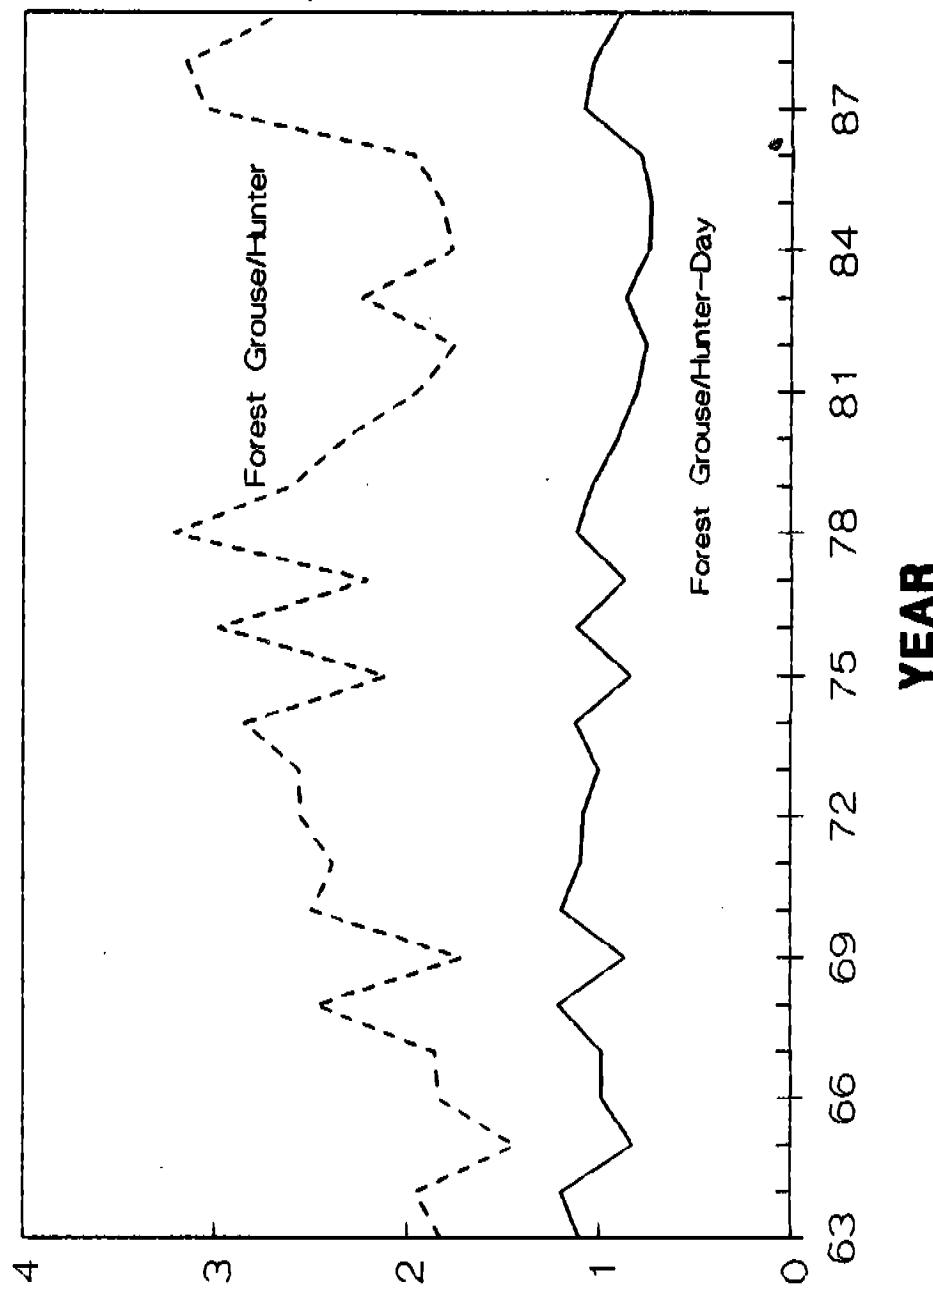

Figure 2. Statewide trends of forest grouse hunter success rates, 1963-89.

Field Bag Checks

A summary of field bag check data for 1989 is found in Table 18. Hunter success trends determined via this method are shown in Table 19. Sex and age composition of the harvest as determined from wings is shown in Table 20 and 21. Results of the 1989 survey compared to 1988 and the 10-year (1979-88) average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Total hunters checked	766	+3	-22
Total hours hunted	3,025	+12	-24
Forest grouse per hunter (complete hunts)	0.68	-28	+17
Forest grouse bagged per 100 hours	16	-36	+14
Average hours per hunter-day (complete hunts)	4.39	+17	+9
Hours hunted per grouse bagged (complete hunts)	6.42	+61	-13

Field bag check trends confirmed harvest results of the mail questionnaire. Hunter success (grouse per hunter) decreased 28 percent from 1988 but was still 17 percent above average. This plus the fact that average hours per hunter day increased, and it took 13 percent longer to bag a grouse in 1989 than average, indicates hunters have discovered blue and ruffed grouse hunting and are using the resource more than 10 years ago.

*From 1950 to 1963 a grouse stamp was required to hunt any grouse. In 1964, the entire state was opened to hunting without a stamp.

*Season opener changed to the second Saturday in September from the third Saturday in September.

QUAIL

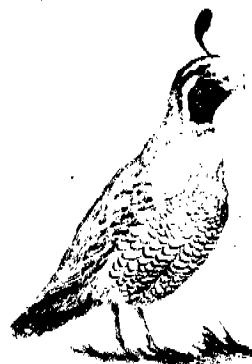

SUMMARY

The 1989 breeding populations of California quail were higher than in 1988, but were still below average. Production of Gambel's quail increased from 1988, but was below average. Production statewide declined in 1989 and was below average.

Statewide harvest statistics, when compared to 1988, showed an increase in total hunters and a decline in total harvest. Hunter success (birds per hunter-day) declined 16 percent and remained below average statewide. There was a 77 percent increase in hunter days afield and no change in total harvest of Gambel's quail reported in Washington County.

There has been a long-term decline in hunter success and total harvest in Washington County; however, there has been an increase in production trend indices. The 25-year average young/100 adults index is 290/100 which is about what is needed for population stability. Given the extensive urban development in the St. George-Hurricane areas since 1962, the decline in total harvest and hunter success is only partly attributable to habitat loss. There are areas that sustain quail populations that cannot be hunted because of urban expansion (i.e. Bloomington, Bloomington east, Santa Clara River below Santa Clara, north of St. George). These were popular hunting areas in the early 1960's (D. Nish personal communication).

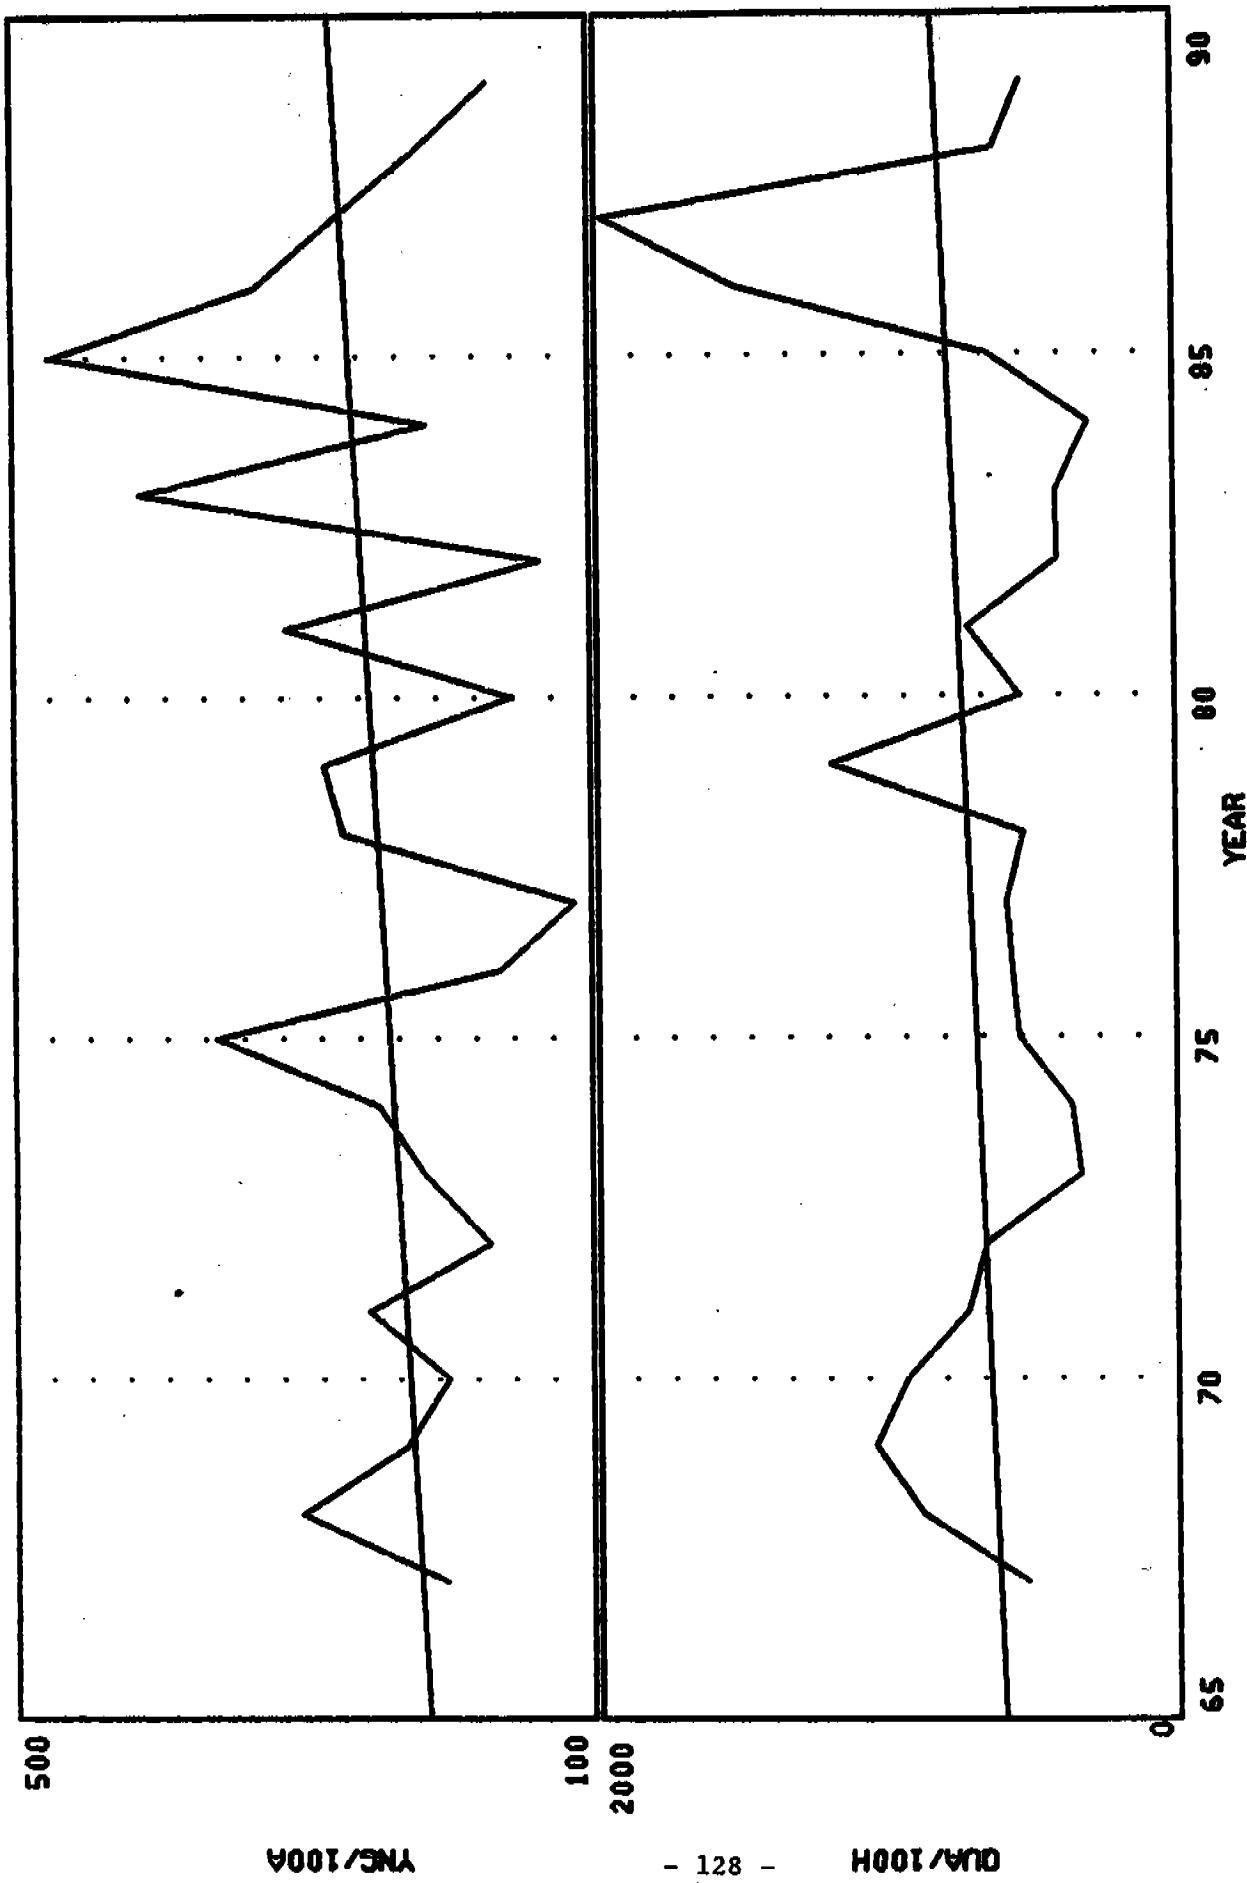

Figure 1. Statewide quail production indices, 1967-89.

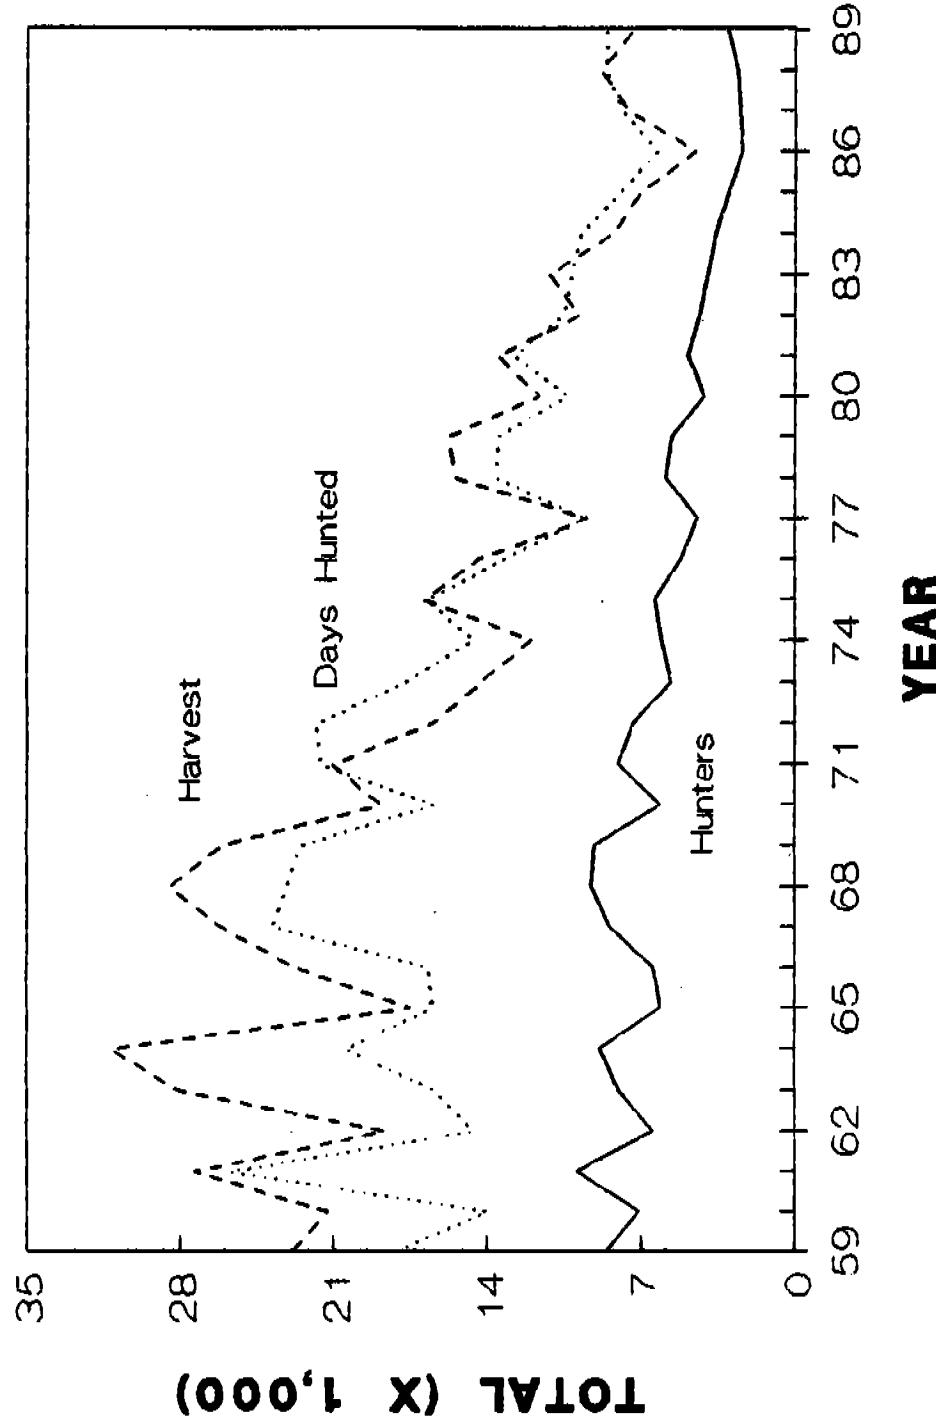

Figure 2. Statewide trend of quail harvest statistics, 1959-89.

Brood Counts

Results of the annual random brood counts for 1989 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4 and Figure 1. Gambel's quail long period waterhole count trends are in Table 10. Survey results for 1989 compared to 1988 and the previous 10-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Total quail observed	89	-80	-83
Young per 100 adults	170	-23	-40
Mean brood size	4.50	-38	-36
Quail observed per 100 hours	524	-16	-37
Total hours effort	17	-69	-76

Harvest statistics for 1988 indicated an increased breeding population of quail statewide. In Washington County hunter success rates remained about the same as the previous year. Apparently, there was good overwinter survival.

Brood count effort was greatly reduced in 1989 due to excessive workloads. Only 89 quail were observed in 1989 which was 83 percent below the average of 516. Total hours of effort on brood counts was 17 compared to 71 hours average for the last 10 years. The production index of young per 100 adults for Gambel's quail was 54 percent higher than what it was the previous year. Production statewide declined from 1988 and was below average.

Temperatures were above average and precipitation below average in the Dixie climatic subdivision March through July. January and February were colder and dryer than normal. This drought did not foster good brood production.

Harvest

Results of the annual hunter questionnaire for 1989 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1989 season to 1988 and the previous 30-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Quail hunters	3,111	+16	-49
Quail harvested	7,384	-17	-56
Hunter-days afield	8,607	-1	-43
Quail per hunter-day	0.86	-16	-21
Quail per hunter	2.37	-28	-13

Harvest for 1989 decreased 17 percent from 1988 and was 56 percent below average. This was consistent with decreased production of quail, perhaps due to drought.

In Washington County (Gambel's quail), hunter success decreased 45 percent but hunter days afield increased 77 percent from 1988. Total harvest remained about the same. Thirty-two percent of the statewide harvest of quail was taken in Washington County during 1989 compared to 28 percent in 1988, 43 percent in 1987, nearly 29 percent in 1986 and 36 percent in 1985.

Long-term quail harvest statistics are shown in Figures 2 and 3.

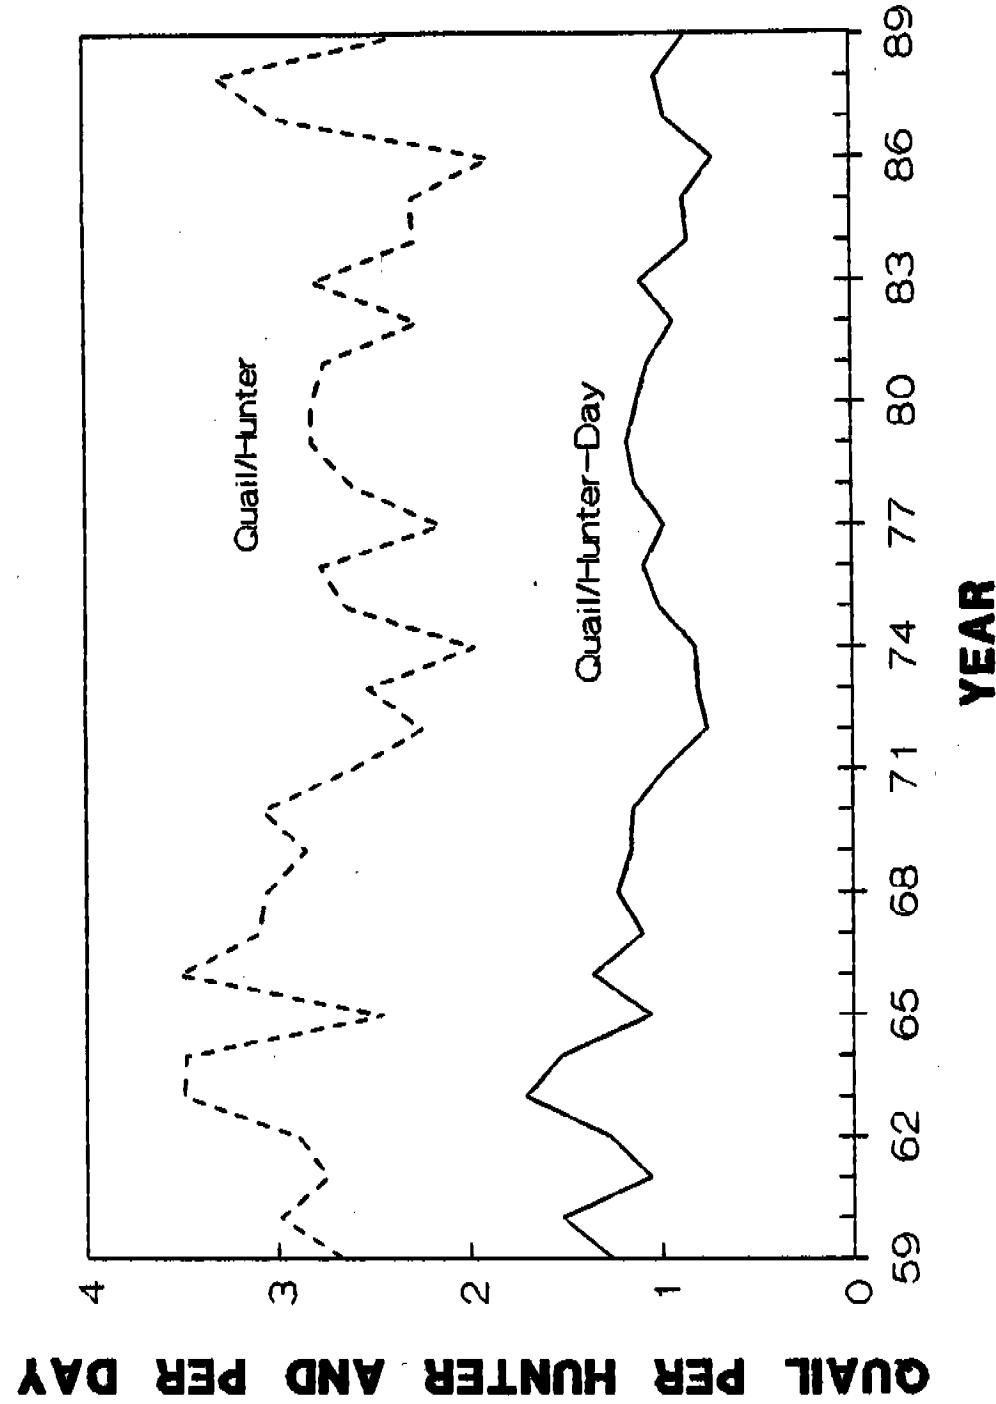

Figure 3. Statewide trend of quail hunter success rates, 1959-59.

HUNGARIAN PARTRIDGE

SUMMARY

Harvest data for 1988 indicated below average breeding populations for 1989. Limited brood data was collected in Box Elder County and indicated increased Hun production.

The 1989 hunt data indicated increased hunting pressure on Huns when compared to 1988. The number of Huns harvested decreased 11 percent in 1989. Hunters afield decreased 14 percent. Total hunters, days afield, harvest and hunter success were significantly below the long-term average.

We expected continued improvement in Hungarian partridge populations in Box Elder County due to the large quantity of agricultural land set aside in the Conservation Reserve Program, but this did not occur. The decline in production and harvest in 1989 was possibly due to the hot, dry summer.

U
N
S

Brood Counts

Results of the annual random brood counts for 1989 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1989 compared to 1988 and the previous 10-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Total Huns observed	21	-73	-64
Young per 100 adults	425	+30	-19
Mean brood size	8.50	+9	-16
Huns observed per 100 hours	--	--	--
Total hours effort	--	--	--

Harvest data for 1988 indicated a below average breeding population for 1989. Hungarian partridge should have overwintered well since January and February were dryer than normal but temperatures in the Western and North Central climatic subdivisions were 8 degrees below normal both months. Young per 100 adults increased 30 percent from the previous year but was 19 percent below average.

Harvest

Hunter Questionnaire

Results of the annual hunter questionnaire for 1989 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1989 season compared to 1988 and the previous 30-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Hungarian partridge hunters	2,136	-14	-41
Hungarian partridge harvest	3,920	-11	-50
Hunter-days afield	6,035	+12	-33
Huns per hunter-day	0.65	-21	-21
Huns per hunter	1.83	+2	-9

Hungarian partridge hunting pressure increased but total hunters decreased. Success decreased 21 percent from 1988. Harvest was 50 percent below the 30-year average.

Field Bag Checks

Results of the survey for 1989 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indices obtained for 1989 compared to 1988 and the previous 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>		<u>Average</u>
Total hunters checked	23	-71		-81
Total hours hunted	59	-76		-92
Huns per hunter (complete hunts)	9.50	+813		+1,692
Huns bagged per 100 hours	181	+654		+1,408
Average hours per hunter-day (complete hunts)	5.25	+22		+51
Hours hunted per Hun bagged (complete hunts)	0.55	-87		-96

Field bag check data submitted in 1989 was for Box Elder County only, and was collected at the game checking station at Snowville, Utah. Many of these hunters are hunting sagegrouse, but Huns are often found in the same areas. Sample sizes were too small to derive meaningful conclusions.

WILD TURKEY

SUMMARY

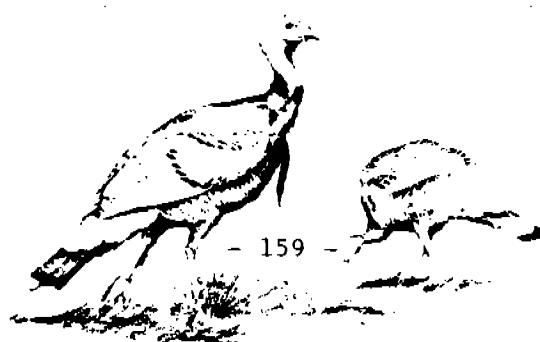

Turkey populations continued to improve on all units, and the increasing numbers are again reflected in the reported observations and the annual harvest.

Hunter success and turkey observation data for the 1989 spring season indicated that the East Zion area had another good year even though total harvest and percent success declined 20 and 25 percent respectively. Thirty-five birds were reported harvested for this unit. The Boulder Mountains and LaSal Mountains still indicated growing populations. Harvest statistics indicate the Boulder population was up from the previous year while the LaSal population declined slightly. The remaining units of the state were closed to hunting. Rio Grande turkeys were released on Pine Valley mountain in 1984, but the population was not considered to be huntable in 1989. A fall turkey hunting season was not held anywhere in 1989.

Spring hunting pressure was up again in 1989. Complaints about hunters interfering with each other due to over-crowding were common. Concern for hunter safety prompted a change in regulation. The season opened May 1 rather than the Saturday nearest May 1. Five out of seven years the season will open on a weekday. It is quite obvious that hunter interest in spring turkeys outstripped supply. We need to continue to establish new populations, then cautiously promote safe ethical hunting practices.

Hunter success was down 25 percent. A total of 59 turkeys were harvested in the spring hunt of 1989 compared to 66 taken in 1988 and 60 in 1987. Observations of turkeys remained higher than average in 1989, but percent of hunters observing turkeys dropped on the LaSal Mountain area.

Temperatures in southcentral and southeastern Utah were well below normal in January and February, and well above average in March and April. Precipitation was below normal all year in the southcentral climatic subdivision (E. Zion turkey unit). This was the second year of drought in southern Utah and may be adversely affecting brood survival.

Harvest

Spring Gobbler Season

Results of the 1989 spring season are shown in Table 1 of this section. The trend of these data since the first spring season in 1969 is shown in Table 2 and Figures 1 and 2. Specific harvest information is listed in Table 3. Statewide summary of fall hunt statistics is in Table 4. The 1989 spring season compared to 1988 and the previous 20-year average follow:

		<u>Percent change from</u>	
	<u>1989</u>	<u>1988</u>	<u>Average</u>
Permits sold	527	+8	+191
Hunters afield	477	+13	+194
Turkeys harvested	59	-11	+195
Hunter-days afield	1,568	+24	+251
Percent hunter success	12	-25	+9
Turkeys bagged per hunter-day	0.04	-20	0
Percent of hunters who observed turkeys	55	+10	+45

Permit sales and hunters afield increased from 1988 and were well above average. Total harvest decreased from 66 in 1988 to 59 in 1989, which is still nine percent above the 20-year average. Although harvest rates dropped from an all-time high, hunter success rates remained above average. The proportion of hunters who reported having observed turkeys was 45 percent above average. The East Zion unit accounted for 49 percent of the hunting pressure based on hunter-days afield, compared with 54 percent in 1988. The East Zion unit yielded 59 percent of the 1989 statewide harvest.

The trend of spring turkey harvest statistics is shown in Figures 1 and 2. Eight percent of the hunters (23) used bows and 1 percent used rifles (2) which were illegal. Five turkeys were reported crippled and not recovered. Three of 40 known kills were suspected of being females and another twelve are suspected of being jakes.

Twenty-five percent of the harvest (9 of 36) occurred on opening day (Monday) 14 percent the following day, 6 percent the first weekend and 11 percent the last weekend of the hunt. Thirty-three percent of the harvest occurred on weekends compared with 44 percent last year (1988). It appears that opening the season on May 1 instead of Saturday nearest May 1, did what was intended by spreading harvest and pressure out over the season.

Four of 359 hunters commented that there were too many hunters. This was down from the previous year. Twenty-four commented that there were not very many turkeys or they would like more turkeys. This was up from the previous year. Eighteen hunters commented that they would like to see the spring turkey season opened 1-3 weeks earlier.

()Hunters hunted more than one area; data included in specific area hunted.

^aFigures do not sum because these hunters hunted another unit as their primary hunting area and were not counted twice.
Hunters afield and days by unit were as follows: Boulder (2-3), both of these were from E. Zion as their primary unit,
East Zion (1-4), from LaSal; LaSal (1-2), from East Zion.

*Some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

**During 1968, the Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

***Closed Season

SHARP-TAILED GROUSE

SUMMARY

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharp-tails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, 'sharp-tail' habitat was directly converted to farmland or was seriously impacted by heavy grazing.

There was no legal harvest of sharp-tailed grouse from 1980 through 1989. In 1988 and 1989, the number of birds present on active dancing grounds was substantially greater than in recent years (Table 1.). Two grounds, White's Valley and North White's Valley, which had been inactive for several years prior to 1987 were active again in 1989. It appears sharp-tailed grouse have made a mild recovery. Concurrent with the upswing in sharp-tailed populations has been a succession of mild winters. Since the catastrophic winter of 83-84, all winters have been normal or milder than normal except 1988-89. This certainly must be a factor in the population resurgence (Grandison 1988 personal communications).

In Box Elder County, habitat associated with existing populations of sharp-tailed grouse has been relatively unchanged since 1983 except that about 100,000 acres in Box Elder County have entered into CRP. This may be benefitting sharp-tailed grouse populations by providing undisturbed nesting cover. The value of CRP to wildlife in Utah is being studied.

We have almost no recent data on sharp-tailed grouse populations in the Cache, Weber, and Morgan county areas. By 1984, populations in these areas were at or below minimum viable population levels. Since that time, we have not recognized any sign of significant recovery. Habitats in all these areas remain marginal. Land use patterns have not shown any sign of reversing the trend of gradual loss of habitat (Grandison 1988 personal communication).

Average number of grouse/ground			10.4	11.3	4.7	1.5	3.4	2.1	2.5	2.6	14.0	11.3	6.7	7.0

*Counts for Pocatello Valley #1 and #2 were combined.

**High sagebrush precludes accurate count, thus birds must be counted when flushed. An estimated range in count is made which includes females. Estimated counts are West Hills #2 (45-48), North Whites Valley (9-11), and Pocatello Valley #2 (12-15). Since visitation by females at any given time is low, an estimated 90% of the grouse seen on the ground are males. Therefore we have arrived at estimated figures of 40, 9, 12 respectively.

PTARMIGAN

SUMMARY

The white-tailed ptarmigan (*Lagopus leucurus*) was introduced into the Uinta Mountains of northern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

Surveys on the ptarmigan population continue to document habitat expansion. Two survey techniques are used. A breeding territory survey is conducted from mid- to late June. A brood survey is conducted from mid- to late August. Results of the last 10 years of survey data are located in Tables 1 and 2.

The 1988-89 winter was relatively harsh in northern Utah.

No spring survey of breeding territories was made in 1989.

Brood surveys were conducted in the Upper Yellowstone River drainage. Two broods were observed. Average brood size was 4.00 young.

Hunter Success

Twenty hunters bought \$2.00 permits to hunt ptarmigan in Utah in 1989 (Table 3). An estimated 3 hunters actually pursued ptarmigan and 13 birds were killed. Hunter success was 0.72 birds bagged per hunter-day.

Many permits are obtained by sportsmen who think they might hunt during a fishing or elk hunting trip, but don't seriously plan on the ptarmigan hunt.

PTARMIGAN

Table 1. Summary of white-tailed ptarmigan breeding territories (pairs), 1979-89.

County	Location	(6/18-24)			(6/12-17)			(6/12-14)			(6/16-17)			(6/18-19)			1989 ³

Summit	Beaver Creek	3	0																
Summit	Smith's Fork		1																
Uintah	Leidy Peak		0 ¹																

¹A sighting of ptarmigan was reported by a hunter in October 1979. Division Biologists reported droppings at the base of Leidy Peak in the willow on June 25, 1981.

²Excessive snow cover precluded access to trail-heads during the June breeding period.

³Investigator was incapacitated.

COTTONTAIL RABBIT

Roadside Counts

Results of the annual roadside counts for 1989 are shown in Table 1 and Figure 1 of this section. The long-term trend of cottontails observed per mile and young per 100 adults is shown in Figure 4 and Tables 2 and 3. Indices for 1989 compared to 1988 and the 10-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total miles driven	872	-41	-52
Total cottontails counted	408	-51	-44
Cottontails observed per mile	0.47	-16	+31
Young observed per 100 adults	64	-4	-30

A decreased breeding population for 1989 was again indicated by 1988 harvest statistics for the fourth year in a row. However, production data from roadside counts indicated a decline in population. The cottontail per mile index decreased 16 percent but was above average. However, production was 30 percent below the average.

Harvest

Hunter Questionnaire

Results of the 1989 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figure 2. Results of the 1989 season compared to 1988 and the 22-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Cottontail hunters	22,878	-5	-8
Cottontail harvest	120,075	-20	-26
Hunter-days afield	91,264	-6	-9
Cottontails per hunter-day	1.32	-15	-9
Cottontails per hunter	5.25	-16	-13

Total hunters and effort decreased in 1989. Total harvest decreased significantly from 1988. Total harvest was 26 percent below average and success was 9 percent below average. Harvest data indicate a year of below average populations of cottontails. The drought may be negatively affecting rabbit populations statewide. A population crash was apparent in the spring of 1984, and has been confirmed by the 1984 and 1985 harvest data. Populations recovered rapidly in 1986, 1987, and 1988. Populations may be headed downward again. The last four winters have not been harsh.

Field Bag Checks

Results of field bag checks for 1989 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. Following is a comparison of the 1989 field bag check data to 1988 and the 10-year average.

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Total hunters checked	80	-79	-42
Total hours hunted	153	-86	-54
Cottontails per hunter (complete hunts)	2.15	-20	+23
Cottontails bagged per 100 hours	95	+36	+58
Hours per hunter-day (complete hunts)	2.27	-29	-25
Hours per cottontail bagged (complete hunts)	1.06	-12	-53

This data is consistent with mail questionnaire data. Hunter success (cottontails per hunter) declined but was well above average.

SNOWSHOE HARE

Harvest

Results of the 1989 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. Trend in statewide harvest statistics by year is shown in Table 15. The 1989 season compared to 1988 and the 14-year average follow:

	<u>1989</u>	<u>Percent change from 1988</u>	<u>Average</u>
Snowshoe hare hunters	4,895	+4	-7
Snowshoe hares harvested	8,006	-3	-28
Hunter-days afield	13,233	-14	-15
Snowshoes per hunter-day	0.61	+15	-8
Snowshoes per hunter	1.64	-6	-17

Significant misidentification of white-tailed jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties. Several attempts were made in the 1970's to reduce misidentification through pictures and descriptions in leaflets and questionnaires.

The 1988 and 1989 questionnaires and 1989 Upland Game Proclamation had drawings and descriptions of the various rabbits in an attempt to reduce misidentification.

Results of the 1989 questionnaire indicate a 15 percent increase in hunter success compared to 1988. However, success was below the 14-year average.

It is unknown what proportion of the reported snowshoe harvest is actually white-tailed jackrabbits that were incorrectly identified by the hunters. However, it is believed that identification has been improving as a result of efforts to educate the hunter on the differences between the various species of hares found in Utah.

Table 11. Summary of snowshoe hare hunter success and distribution of harvest and hunting pressure by region and county, 1989.

APPENDIX A

WEATHER CONDITIONS

Weather information used in this report (Tables 1 & 2 and Figures 1 & 2) is from the office of the Utah State Climatologist and N.O.A.A. Climatological Data Periodical.

The 1988-89 winter weather was relatively mild again. Below average precipitation fell between December 1988 and March 1989 but December 1988 through February 1989 temperatures were well below average. April and May precipitation was below normal across, most of the seven climatic subdivisions.

Temperatures remained above average March through July while precipitation averages stayed below normal. This warmer weather and below average precipitation may have hindered hatching successes and reduced brood survival for some upland game populations.

Table 1. Comparison of 1989 monthly average temperatures (F) to the normal for each weather division and statewide.

APPENDIX B

LICENSE SALES

Small game license sales by type and cost are listed in Table 1. The number of licenses sold for all types, except nonresident and juvenile, increased slightly in 1989. Juvenile small game license sales probably decreased in 1988 and 1989 due in part to legislative change in juvenile-adult age break from 16 to 14 years of age. However, adult resident small game licenses did not increase the same amount as juvenile small game licenses decreased to compensate.

Likewise, the proportion of Utah's population hunting small game is declining (Table 2). In the early 1970's about 10 percent of Utah's population was hunting small game. By 2000, we project that only 6 percent will be hunting small game.

Table 3 identifies revenue generated to Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and field service.

Table 1. Statewide small game license sales information, 1954-89.

¹Value does not include cougar, bear, turkey permits and commercial hunting area licenses. It does not include NRSG Revenue - this is assumed to be primarily non-resident bear and cougar hunters.

²Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses. They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sale when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license fee plus the resident big game license fee plus the resident small game license fee or \$9.33 for 1989.

³Total federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

⁴Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal Duck Stamps are not required of juveniles less than 16 years of age.

APPENDIX C: Regional and statewide summary of effort expended on upland game summer surveys.

Generally hours spent and miles driven on upland game surveys in Utah have declined since 1971. This is the result of competing uses of time for biologists and conservation officers. In addition, the restriction on conservation officers to a 40 hour work week by the Fair Standards and Labor Act has further eroded survey effort. When effort and results have reached a lower critical sample size, surveys have been eliminated. Effort by conservation officers on upland game surveys in the Southeastern and Central Regions have been minimal for several years because of specialization. Conservation officers and biologist duties were separated into law enforcement and game management, respectively, in these regions two years ago. Rumors of similar re-organization may have reduced CO effort on upland game surveys in other regions in 1989. Under Phase I of the reorganization, there should be an increase in game management personnel and a significant improvement in upland game survey effort beginning in 1991.

Table 1. Regional and statewide summary of effort expended on upland game summer inventory, 1971-89.

APPENDIX D: Season dates, bag limits and areas open by upland game species, 1989.

<u>Species</u>	<u>Season Dates</u>	Daily Bag Limit	Possession Limit	Area Open
Pheasant	Nov. 4-17	2 cocks	4 cocks	Statewide
	Nov. 4-Dec. 3	2 cocks	4 cocks	All state and federal lands (including private lands leased by the Division subject to restrictions and closures imposed by administering agencies) in Carbon, Duchesne, Emery, Grand, Juab, Millard, San Juan, Sanpete, Tooele, and Uintah counties.
Mourning dove	Sept. 9-30	10	20	Statewide.
Band-tailed pigeon	Sept. 1-30	5	10	Beaver, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Utah, Washington and Wayne counties.
Chukar	Sept. 9-Nov. 30	5	10	Cache, Davis, Morgan, Rich, Sanpete, Summit, Wasatch, and Weber counties and portions of the following counties lying east of Interstate 15: Juab, Millard, Salt Lake, and Utah; and those parts of Duchesne and Uintah counties south of Highway U-40; parts of Box Elder and Sevier counties.
	Sept. 9, 1989-Jan. 31, 1990	5	10	Beaver, Carbon, Emery, Garfield, Grand, Iron, Kane, Piute, Tooele, Washington, Wayne and those parts of Juab, Millard, Salt Lake, and Utah counties lying west of I-15. Also parts of Box Elder, San Juan and Sevier counties.

APPENDIX D (continued)

Species	Season Dates	Daily Bag Possession			Area Open
		Limit	Limit		
Sage grouse	Sept. 9-17	3	6		Garfield (part), Piute, Sevier, and Wayne counties.
	Sept. 9-17	2	4		Beaver, Box Elder (part), Carbon, Daggett, Duchesne (part), Emery, Garfield (part), Grand, Iron, Kane, Rich, Uintah, Utah (part) counties.
	Sept. 12-13	1	2		Tooele (part) County.

The following counties were closed to sage grouse hunting during 1989:

Box Elder (part) Cache,
Davis, Duchesne (part),
Juab, Millard, Morgan, Salt
Lake, San Juan, Sanpete,
Summit, Utah (part),
Wasatch, Washington, and
Weber.

Forest grouse	Sept. 9- Nov. 30	4 (aggregate)	8 (aggregate)	Statewide.
Quail	Nov. 4-17	5	10	Beaver, Box Elder, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Uintah, Utah, Wayne and Weber counties.
	Nov. 4-Dec. 31	5	10	Washington County.

Cache, Morgan, Rich, Sanpete, Tooele, Summit, and Wasatch counties were closed to quail hunting in 1989.

Hungarian partridge	Sept. 9, 1989- Nov. 30, 1990	5	10	Box Elder, Cache, Davis, Morgan, Rich, Summit, Tooele, and Weber counties.

1989	12,894	5,135	39.8	5,105	39.5	36.7

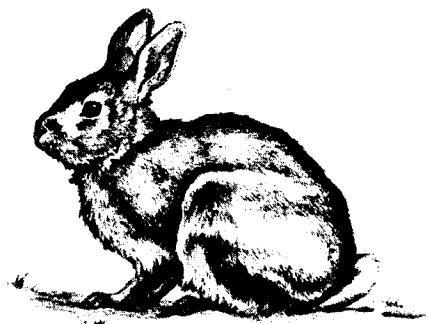

RABBITS AND HARES

SUMMARY

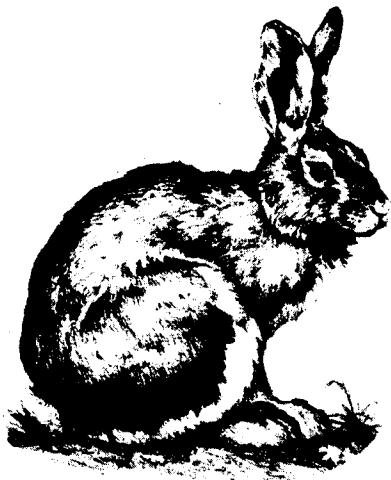

An increased breeding population for 1989 was indicated by the 1988 harvest statistics. Cottontail populations decreased from a short term high in 1988 but are above the 10 year average.

Summer roadside counts indicated a decreased population density statewide. Harvest statistics indicated decreased hunter success, with a total harvest decrease of 20 percent. Field bag checks on opening weekend indicated above average hunter success.

Cottontail Rabbits

Snowshoe Hares

The 1989 snowshoe hare hunting season indicated improved populations but they were still below the 10 year average.

Hunter pressure remained about the same as the previous year but was below average. Although efforts have been made to educate hunters in the identification of the snowshoe hare and the white-tailed jackrabbit, it is still a potential problem which could bias the snowshoe data.
